Maybe another workaround is also possible:
Which Harddisk driver do you use ? With the driver I'm using (HDDRIVER)
you can freely assign drive letters to any partition. If you just do NOT
assign one of the letters C to H to one partition, but use another letter
for that drive instead, you would have a free letter again to use for your
ramdisk. It's a little bit unconventional, but it might work for you.

Hi John,

JD>No matter how much I reformat, however, the same message appears. The
JD>formatting procedure does not show any problems, so I'm stuck... Any
JD>ideas?
I'd try a non-Atari formatter, e.g. CBHD or (recommended) HDDRIVER...

JD>(with Atari utilities, v.5.0)
most recent AHDI AFAIR should be 6.061 (or something similar)

You may have a look at the WINCAP file - pure ASCII - and verify if
the partition scheme you want to install figures there. You might add
it! SH205 should be the same as MEGAFILE20.

I have done it before. I have a program (for a PC) that converts a
ST file to a MSA file. Then I have a program for the Atari ST
that converts the MSA file to a regular ST disk. If you want the
programs email me...

Hello,

How big would the partition be and under what TOS are you trying
to do this? Under regular TOS the max is 32 meg.

Yes !! And a perfectly working CT60 for those Falcon users that ordered one. And also a complete easy-to-install Linux/Aranym installation on CD that makes a (very) fast TOS compatible computer system available for a modest price to everyone. And is MagicMac for MacOSX ready yet ? Let us not start that clone vs. emulator discussion again. The more computers that can run Atari applications the better. Especially if this will encourage programmers to develop for our wonderful platform !

14. ICD FA*ST External Drive Problems

Newsgroup: comp.sys.atari.st
Date: 2003-01-02 00:50:36 UTC
From: sean0ceallaigh@yahoo.com
Message-ID: <c6402c6a.0301011650.604dd978@posting.google.com>
Source record: 30194
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've had some trouble with an ICD FA*ST external drive.
Sometimes when I power it on, in combination with my
1040 STE it boots up. Other times, when I power it on,
I hear a 'clik' and it doesn't boot. When it doesn't boot
I've run the ICD utilities from the A drive of my STE and
I can detect the drive, it just can't see the partitions anymore.

Has anyone else had some trouble with booting from ICD FA*ST
drives? It has an 80MB Quantum SCSI inside. Should I look
at replacing the driver, or is it a problem with the host adapter
in the ICD FA*ST box? If I do look at replacing the drive, I
imagine I'd have to shop for a used RLL type SCSCI to work with it.

>
> Yes Football Manager 2 is what I should have said, sorry.
> Did you like the game?

Sure did. It was very different from the Atari 8-bit version, which
was what I was trying to get hold of originally, but still good.

IIRC the 8-bit versions varied enormously - despite the better graphic
modes of the 800XL it was a text game,while it was graphical on the
Spectrum\Amstrad machines of the time. When I got myself an STFM in
about 1988 the first two programs I was looking to get were Mini
Office and Football Manager 2.

I wasn't any good at the footie games that involved contortions of
fingers to manipulate individual players like some of those around, so
FM2 suited me.

I thought there used to be a ST157A and a ST157N. The 'N' denoted SCSI
- am I getting confused with the 'A' designating a Mac drive or is it
just for IDE?

> I took another SCSI drive out of an old PC box I have here,
> basically the same, but at least the drive is recognized during

That means you've got HDD to scan all the SCSI number at bootup - you
haven't bypassed it in HDDriver.

Ok, I didn't realsie that. When you said it ws the original drive I
assumed it was a 3.5" originally from the internal bay.

I don't think there is any setting that can influence Doom or any other
kind of software. Is there any difference in your driver configuration
after re-installing HDDRIVER? If I understand you correctly everything
was working fine before the re-installation.

This is a known bug in (at least some versions) of Atari's hard disk
utilities. I have seen it often on the TT or Falcon.
Using another version of these tools might help or, of course, using a
different driver software.

That should be no problem -the whole HDD is just 20MB anyway... My STe has
TOS 1.06 but I'm loading TOS 2.0 on top of it, by the way.

Cheers

Yup, it's a 1040STe with 4MBs. I do have a 1040STFM too, though, so I'll
check it out there. Where would the fault with the DMA lie -and is it so
common?

Thanks for the tip, it was driving me crazy! Do you happen to know where I could find some other version of the utilities -or some other driver software that you could suggest?

It sounds like the drive has started to get "tired" and is not spinning up to speed on power on. This usually gets worse until eventually it stops working all together.

> Has anyone else had some trouble with booting from ICD FA*ST

I would almost certainly suspect the drive, and look at replacing it.

>or is it a problem with the host adapter
> in the ICD FA*ST box?

I doubt it very much its the ICD..

> If I do look at replacing the drive, I
> imagine I'd have to shop for a used RLL type SCSCI to work with it.
>

If its SCSI it matters not how the drive underneath is encoded. Drives that conform to the original SCSI I standard usually have a 50 pin connector. RLL and MFM have two connectors (I think one is 34 pin and the other 14 but don't quote me) so it should be easy to tell what type of drive it is.

What is important is what SCSI options the drive needs to work. I guess that like most Atari host adaptors the ICD does not do Parity and does not have a SCSI ID. If so you will need a drive that works in such a configuration, which may be hard to find these days. I have had some success with drives up to 1 Gig, but nothing over has worked for me.

I don't know where to find other versions of HDX, but you might want to
check out HDDRIVER (http://www.seimet.de/hddriver_english.html), which
is a commercial driver.

I have absolutely no idea, Harry. Have you tried Seagate's website? They
still have information there on the 'N'. I picked it up during all this
just for info someday.

Must have posted something that was confusing. The ST157N is the original TT drive, 3.5", and was in the internal bay. It is now sitting on a box, most likely destined to be an emergency boot disk for "something" Atari. The external drive that used to be a boot drive is in an old pizza box style (not an Atari pizza box) case, and was my boot drive on my Mega 4. The drive there is an old 5.25 Micropolis. The external case will hold 2 drives, and the Micropolis now shares the box with a Maxtor drive.

BTW, two of the four used drives I bought were Maxtors. I had trouble finding the jumper settings for the Maxtor on the web, so went to Maxtor's site. They no longer support either drive, but were very helpful in helping me locate the settings, one on Maxtor's site, the other on Dell's. I think these people understand the phrase "customer service", as I'd sure lean toward buying a new Maxtor if that was my need at the moment.

Most sudden failures are due to bad solderings on the high-voltage
transformer legs...
Schematics (maybe not the best quality, but still...) can be found here:
http://www.fortunecity.com/skyscraper/quadra/455/

Best regards,
Claes

http://www.fortunecity.com/skyscraper/quadra/455/ contains some schematics,
but unfortunately not for the SM125...
I don't know if the schematics would help, since there were many different
models of all Atari monitors - but mostly it was only possible to get
schematics of one - at lest here in Sweden... :(
Check for bad solderings on the high-voltage transformer's legs. That's the
most probble cause of the failure.

Best regards,
Claes

I think the Belgium server is not updated -I *think* that's where I looked
in the first place. UMICH has up to v.5.0.4 and an update from 6.0 to 6.01,
but this should be enough...

Thanks for helping :)

Hi Uwe,
I did have a problem with HHDriver not recognizing some partitions by
ICD so I went back to ICD until I re-partitioned with HDDriver. I've run
most of my software with HDDriver installed and Doom has the only problem!
I noticed that HDDriver seems to speed up access to the hard drive (an old
Seagate 1 gig) so I disabled cache and Phantom SE excelerator but it still
crashes on loading Doom so I boot from the floppy with ICD for Doom only!

Roger,

Sorry to hear about your father in laws passing.

Yes it is worth something, but you would have to decide if its worth the trouble to post on ebay or yahoo or somewhere. Check both of those and do a search for 1040ST, or atari 1040. Its probably about $40 for the system and I don't know how much more for the software. Another option is to offer it here. If you offer to give it away to just pick it up, you might be amazed how many people come out of the woodwork :)

Tony

Hi David,

Thank you very much for sending RDE_5 ramdisk.

Today my ISP changed something with their newsgroups.
As a result I had some 6,000 messages in my mail box from
this newsgroup.
I called them to please delete, but of course instead of
deleting the 6,000 they go in and delete all of my personal mail.
(Including RDE_5 ramdisk)

Could I trouble you to resend.
Is it possible to send a .ZIP file
as an attachement
that I can extract with STZiP?
I don't have a P.C.

Thank you

ken

Hi Robert,

>> are the recent Yamaha writer being supported by CD Recorder?
>
>I do not use CD Recorder.

More or less...
Up untill the previous model (2200S) there was no problem, but the recent
model doesn't allow burning at 4X, it jumps from 1X straight to 8X, which
unfortunately is too fast for Atari hardware.
It's a software related problem, since with CD-LAB it's possible to select
the 2X and 4X speed options.

Cheers from Belgium
Dennis

Note that drive partitioned with old versions of the ICD software are
not Atari-compliant wrt to the partition layout. Fully compatible
drivers like HDDRIVER will thus only recognize the first 4 partition.
The ICD2AHDI software on the HDDRIVER floppy disk fixes this problem by
converting the ICD partitioning scheme to the AHDI scheme without any
loss of data. Afterwards the ICD driver as well as any other driver will
find all partitions.

Sorry, but I found that the worst culprit was an electrolytic capacitor in the power supply that was
underdesigned for the load, and started leaking, and finally overtaxed the poor power supply. Sadly I don't remember just which one, it has been too long ago

usually in my country, when something is repaired, related or not, they always blanket change all the cap's in the power supply. They always fail at some time or another. sort of like preventative maintenence.

could be a blown fuse caused by a shorted horizontal output transistor, what are the exact symptoms of your monitor. There all much the same and perhaps I could give you an idea what to look at.

The number of pins on a SCSI drive are pretty irrelevant (unless there are too few for your cable that is).
Falcons have no difficulty operating the SCSI2 standard (which is what a lot of 68 pin SCSI kit is).
As it is so small (36.7 Gb), yo will have no problem hooking it up.
After a bit of editting of the old hard drive definition file, you will be up and running fine.

All SCSI devices I have come across have been about to be hook into older lower SCSI versions.
I have even seen an brand new low voltage differential SCSI 3 drive operate as SCSI 1 (the old 25 pin Dtype).
Total waste, but it worked...

Modern SCSI drives will last for a very very long time, but it sounds that the one you have got is not new, but hey... for 50 bucks...

> passed, and he wasn't one to throw away things that worked. Is it
> worth any value at all to sell?

Check on eBay. Do a search on "Atari 1040ST" or something similar and then
click the link on the left to see only completed auctions. That'll tell
you what similar systems sold for. Here's a URL to one such search:

http://search-completed.ebay.com/search/search.dll?GetResult&query=atari+1040st&from=R8&ht
=1&combine=y&st=2&SortProperty=MetaEndSort

You may need to do a few variant searches to find a reasonable range of
completed auctions. Some will include irrelevant cruft, like the Byte
magazine in the above search.

Hi Uwe,
Been down that road before! For some other reason HDDriver still had a
problem even after running ICD2AHDI. No problem now that partitioning was
done with HDDriver. Thanks for the feedback.

hi Martin,

n> modest price to everyone. And is MagicMac for MacOSX ready yet ? Let us

MagicMac for MacOSX:

I'm just now using it (iBook, OS X 10.1.5)

- Serial connection only from my 'own' frontend (the_dot),
- no printing from MagiC
- screen redraw sometimes garbled
(mostly well known features - I was prepared).

Slower than the 'older' emu, but Jinnee ist again more responsive than the Finder (which is awkward on OS X)! (well, the applications themselve are different of course).

I can access the Mac file system with PureC-written programms. A lot of TOS-programs give up on filenames with spaces, e.g. PureC. They need a traditional TOS-path for file access, which is still konfigurable (but limited).

NVDI is only working as GDOS-part, no screen-acceleration; this hurts remarkably. No more access to Mac-Fonts from NVDI.

Much less shutdowns - more stable than with OS9.

It is still called a preliminary version, not fully featured.

Servus
Franz

Harlekin's ramdisk is reset proof and allows any ID from C: to P:
as well as choice of size. It can also auto-load programs into it
on booting. Look for a second-hand copy of any of the Harlekin
versions. (H 2 was on a cover disk IIRC).

Regards, /Peter/

68. Gem Candy Programing Compo 2002 Voting Needs YOU!

Sean,

I have several of these Quantum drives, the TT030 came stock with Quantum drives of similar type. They fail, some of them fail sooner, some of them later but they definately have a history of failing for me. I do have one of them though that remains very nice and quiet and doesn't give me any problems. Best bet would be to just replace the scsi drive inside with a newer bigger one and cut your losses. You do have backups don't you? ;-)

The drive inside is probably just plain old SCSI-2. Not RLL or MFM or anything like that. You should be able to find use SCSI drives on ebay with the right 50 pin connector for $20 or less.

Mark

ARAnyM, which is a Falcon emulator and runs under Windows and Linux,
STeem, WinSTon, TOSBox which I still use for a few things. There are
probably a few others as well, but these are the ones I use.

73. JXEDITOR 0.7-7b released

Newsgroup: comp.sys.atari.st
Date: 2003-01-04 12:43:20 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0301041337100.184-100000@easymint>
Source record: 30054

Hi,

I've just put JXEDITOR 0.7-7b on my website.
Fixed a little bug in the bankload routine. Big banks with too many
tones/patches were causing strange problems. Not anymore I hope :-)

Not spectacular news, just wanted to let you know that I'm still coding
for Atari + MIDI in the year 2003 !

You can download the new release here:

http://www.home.zonnet.nl/m.tarenskeen/jxeditor.htm

I have never tried running any Atari emulator, since my only computer is a REAL Atari Falcon and I don't even own a PC or Mac.

But this might change in the future. I have had positive reports from people running my YSEDITOR synth editor/librarian on a PC with STeem succesfully. On the other hand I'm not only a MIDI enthusiast, I've also become a FreeMiNT lover lately. This makes me think that a Linux computer running Aranym could be a serious option for me in the future. And it would be nice to avoid Windoze completely. Can anyone tell me if Aranym supports, or will support, the MIDI ports to be able to run Atari MIDI apps ?

It depends what you mean by decent, and what you want to use them for. I have two currently installed on my PC.

1. STEEM (web site appears to be http://www.blimey.strayduck.com/) which is basically an STFM/STE emulator. It emulates most of the hardware, including some MIDI support. It very usefull for running games or other programs that depend on specific details of the ST hardware. Because it will only do standard screen resolutions its a bit limiting if you say want to run compilers or editors.

2. Gemulator (www.gemulator.org). This is a "Higher Level" emulator and allows larger screen sizes and memory than was possible in a normal ST. It is also supposed to be able to read real Atari drives via SCSI. It will run many well behaved games and programs, including Gulam, GCC and a number of other programs.

Hope this helps,

Dave.

I personally use two: GEMulator for 'serieus' stuff (it runs "1st Word
Plus", "GfA Basic" and most properly programmed software). Like someone else
also said, it supports larger hard disk sizes and screen sizes than the
actual ST, as long as its within the abilities of GEM.
Second: SainT. Runs most of the games and cool demos, including the ones
that try to get most out of the Atari ST hardware.
Robert Goodwin and myself used to maintain an Atari ST Emulation FAQ,
however I stopped with that quite a few years ago and I don't know about
Robert. Try a Google search on Atari ST Emulation FAQ and you'll probably
find it somewhere.

77. Unistalling question - whats the proper way to uninstall a program (namely, neodesk)

Newsgroup: comp.sys.atari.st
Date: 2003-01-04 16:52:14 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <rp3e1vkemjtmes5gko70fuc66pb53clh1n@4ax.com>
Source record: 30058

I do have a bit of an atari OS gripe. I bought neodesk 3 to give the desktop a new look on my falcon, have decided it wasnt for me, and have taken it off. Only thing is, when I boot up, neodesk still attempts to load (even when all the program files have been deleted from the auto folder, and from it's program folder. (when deleted, it says it cannot find the folder it's trying to access)

How do I stop this happening - in windows on my PC (sorry to everyone this offends) - I can just go into control panel, and do add/remove.

I tried putting noedesk 3 back on, and going to the install application option, where I noticed a remove option, I try this, delete everything, but it still try's to boot up neodesk after rebooting.

Thanks.... Rob

A second question.... I've seen a few falcon manuals on ebay - germany, and I dont have one, and am wondering if they are multi language and have an english contenet as well as german (and possibly french etc).

For the moment I own a Hades 060, Mac G3 and a pc 2.66 GHz.
Most work is still done on the Hades though.
So far I only have tried MagiCMac. Personaly I really don't like it. For me it's an emulator without a soul if you know what I mean. Under MagiCMac I can't find back the joy I've when I work under freeMiNT/N_AES.
To avoid some misunderstanding (by some people) I don't say MagicMac isn't good. It does its job pretty well but...

Hello,

I am TRYING the program: the Copyist DTP (Music)
In the manual it says: "If you have enough memory, you might consider using a RAM disk for your work directory, since this will even be faster than your hard drive."

I the install application window, make sure the AUTO option isn't highlighted. If it is, change it to normal, save the desktop, and then try rebooting before you delete Neodesk again.

There is a first place to look. Programs can be started from the desktop
information file, and it seems like that is what happened here.

Load that file into a well-behaved text editor, which leaves line endings
alone, and delete that line.

I am trying to install Gemulator 2000, and have attempted to install it, according to the pages on the gemulator home page and also using the Atari st emulator FAQ. it starts, gives me the white screen, tests the memory, and does the wait thing (which does terminate when I hit any key) but then just sits there. Taskinfo (a PC task monitor) shows that it is running, but NOTHING HAPPENS! NADA! NICHTS! I cant get a mouse, no desktop appears! Anyone have any ideas???

That's very bad news! That site was one of my regular haunts, certainly one
of the first places I'd visit for Atari need's.

Does anyone else have any info or ideas

Again, I have to ask...

What in the FUCK do these headlines have to do with Atari?

KaZaa? Aimster? Bonzi.com? WTF?!?!?!?

NOPE! Someone sent me some ROM image files but that didn't work! I have to rename it to Magic_PC.os, or it wont find it! The US versions (both of them) yield a mixed up screen full of an array of little boxes, the 206 UK gives the proper white screen, with the logo, show the ram check and the spin-up bar, and then hangs! It isn't locking the computer, but there is no mouse, no desktop, and I can only ctrl alt del to remove the ST! The program is still doing SOMETHING, according to a task info program I have on the PC, but nothing happens

Bob,
It is a little picky to get going. Try turing off all the advanced features, disable sound etc. until you get it running.(some are on the config, others on their own menus).. Then you can turn some on again till it works...
Dave

If it has one Atari relate article in it then it has everything to do with this newsgroup. What do you contribute, other than ignorant posts? I read and enjoy Atari Online News, I'm glad they take the time to put it together. So what if the name is not 100% dead on. Would it kill you to skip the post...

A word of caution... if I remember correctly, RDE had a bug which, I think,
was not corrected even in teh last version: if the RAM disk gets almost full,
the last few kilobytes (a fixed number, but I don't remember how much),
will get corrupted.

101. dumb question

Newsgroup: comp.sys.atari.st
Date: 2003-01-06 02:25:33 UTC
From: Plisken <Harry@microsun.co.uk>
Message-ID: <3e18e841$0$223$cc9e4d1f@news.dial.pipex.com>
Source record: 30083

Will modern 1.44 disks NOT work with my 520STFM?

I seem to recall the drive being 720Kb. Would it then not be possible to simply first format the disks in the Atari, even though they are 1.44mb?

All comments appreciated...

but doesn't the dos version only emulate simpler versions? and without
Windows accessibility?
Does anyone know where the gemulator stores its values? after running (or
trying to run) a few times, it now does NOTHING, but crashed with a page
fault???

It does work, albeit not for long. 1.44 disks tend to fail alot when being used as 720k disks. It really is only good for a temporary solution.

Mark

Thanks Martin
We really appreciate all the great work you are doing. It makes me
want to get a JX!

We also appreciate our Coders! Its amazing that new programs for Atari
ARE being created in 2003!

Formating HD disks to DD on an Atari worked flawlessly for me for years.
Disk data will not be readable on a PC though.You could think of it as a
security feature...

Thanks all for the help. It does indeed look to be the drive.
I opened the case of the ICD FA*ST and disconeccted the
Quantum SCSI from the adapter board. Even then it had trouble
spinning up. So I will be replacing the SCSI drive.

Thanks again,

Sean

108. Ash and Pure C / Pure Pascal

Newsgroup: comp.sys.atari.st
Date: 2003-01-06 07:22:22 UTC
From: sean0ceallaigh@yahoo.com
Message-ID: <c6402c6a.0301052322.24a09ba4@posting.google.com>
Source record: 30090

Does ASH sell Pure C and/or Pure Pascal to the US? Or
are there any North American distributors in Canada or
the US?

I don't speak German (although my Mom's family is from Bavaria!)
So I can't figure out where ASH sells their products and
whether there is an English version. ASH's online shop only
lists choices in Germany for delivery I think. Kind of
scary that I can go through part way through there online-shop
checkout without speaking a word of the language! :-)

Also, what is ACS Pro?

Thanks,

Sean

109. Megamax Modula-2 Installation help

Newsgroup: comp.sys.atari.st
Date: 2003-01-06 07:28:50 UTC
From: sean0ceallaigh@yahoo.com
Message-ID: <c6402c6a.0301052328.6609daa7@posting.google.com>
Source record: 30091

Hi:

I downloaded Thomas Tempelmann's Modula-2 development
zip file along with the text files from:

http://www.tempel.org/files-e.html

I ran his installation instructions through AltaVista's Babelfish
translation tool. Needless to say I understood the Babelfish
version even less. There seems to be two versions of the Megamax
Modula-2 code around. The first is very basic and small. I was
able to figure out how to set it up and compile/link my Modula-2
code. However, the editor doesn't work at all. It's as if it
were incompatible with TOS and probably something for MagiC.

However, I would really like to install his mm2_dev stuff as
it has the library sources as well. Can anyone describe
for me in English, Irish or French how to get his Modula-2
stuff set up from the above link?

Also, what's up with the editor?

Thanks again!

Sean

110. disk errors

Newsgroup: comp.sys.atari.st
Date: 2003-01-06 12:07:33 UTC
From: Plisken <Harry@microsun.co.uk>
Message-ID: <3e1970a6$0$232$cc9e4d1f@news.dial.pipex.com>
Source record: 30092

I'm having trouble with my 520 STFM reading my older disks, these disks, like the machine have been sitting unused for possibly 8 years or so. As I initially thought that the internal drive could be at fault, I hooked up a second drive, which I know used to work also, but found the same errors. Corrupt data/Invalid disk I think...

Weird thing is that I also have some disks which contained DOS programs from the same time, and they can be read on my Win* machine without any issues.

Any comments and ideas on further testing would be greatly appreciated...

Thanks

Harry

Just Pure Pascal. Don't know if an English release exists.
For a distributor in North America, have a look at ESNA:
http://europe-shareware.org

Bye,
/Pascal/

Sean,

ACS Pro is cool. If I had to describe it, I would describe it as Visual C
for GEM. It works with Pure pascal and PureC to ease GEM window/menu etc
creation.

Mark

113. Ash and Pure C / Pure Pascal

Newsgroup: comp.sys.atari.st
Date: 2003-01-06 16:06:36 UTC
From: Harald Placke <hapla@epost.de>
Message-ID: <06012003162610i2C0044F0EEFFFFFFFF@hapla.de.vu>
Source record: 30093

Hi Sean,

> Does ASH sell Pure C

No, you can't buy PureC at ASH anymore. ASH has stopped the sale
years ago, because they got trouble with the licence-owner. So you can
only buy an used PureC from an other User.

> and/or Pure Pascal

let's have a look in their online-shop.
....
Yes, it is still in the list. For a german customer is this the price:

------------------------------ cut here --------------------------
Pure Pascal Vers. 1.1.1. 50,62 Euro
(215)

transport + 4.00 Euro
total _54.62 Euro_
tax include (16 %) 7.53 Euro

on stock
------------------------------ cut here --------------------------

The price for the update from version 1 to 1.1.1 (part-number: 500) is
15,34 Euro.

If you are a power-user (you are allready registered as a user of one
of their software), than you can buy the full version 1.1.1 (part-
number: 833) for 40,39 Euro. The price for an update is the same as
above.

If you want to buy from a foreign country, you have to pay befor
delivery. And the tax may be different (i don't know). It would be
better to ask them.

> Or are there any North American distributors in Canada or the US?

Sorry, but on the website is no list of their distributers so please
ask them: <mailto:kontakt@application-systems.de>

> I don't speak German

No problem, i do. ;-)

> although my Mom's family is from Bavaria!

But there the people don't speaks german either, they speaks bavarian.
=>;-> (hope you understand the joke <grin>)

> Also, what is ACS Pro?

It is a development-tool for PureC.

Have a look on the authors website: <http://acspro.atari.org/>

But these site is also only in german too, it is better you ask the
author directly: <mailto:acspro@atari-home.de?subject=ACSpro:>

hope it helps

cu Harald Placke

Did you check the 5v and 12v?

The new drive will do the same again if the voltages are down.

Been there, got the T shirt.

I have a collection of old atari software for auction. A list:

List of software:

Mavis Beacon Teaches Typing (2 disks)
Atari XOR by Astral Software
Atari U.S.A. Language Disk for Mega and ST
Mixed up MOther Goose (2 disks)
WordUp 3.0 (5 disks)
WordPerfect (5 disks)
Clue Master Detective
Turbo ST version 1.0
Batman The caped crusader (2 disks)
Captain Blood (2 disks)
Uninvited (2 disks)
GFA Ray Trace
Gridiron The Football Simulator
Jewels of Darkness
Dive Bomber (2 disks)
Barbarian II (3 disks) PAL VERSION
Superman Man of Steel (2 disks)
Operation Wolf (3 disks)
Stacy Atari Advanced Hard disk utilities Stacy Rev A
Hero's Quest I MS-DOS disk 2 of 4 only...
Weird Dreams (2 disks)

List of Manuals:

The Atari ST Book bye Ralph C. Turner
Gridiron The Football Simulator User's Manual
Parent Guide for Mixed-up Mother Goose
Dive Bomber Instruction Manual
Wayne Gretzky Hockey
Weird Dreams
Police Quest 2 Hint book
Clue Master Detective
Final Assault
GEA Raytrace
DEGAS Elite
Atari ST BASIC Quick Reference Guide
Atari 1st word

Everything is as is. If there is something you'd like me to check I
will try it on my 1040st. Ask questions.
I will ship world wide, buyer to pay actual shipping cost only,
nothing else is added. I package very well.

Thanks very much.

120. Converting AtariWorks Spreadsheets

Newsgroup: comp.sys.atari.st
Date: 2003-01-07 04:08:28 UTC
From: "Thomas J. Andrews" <tjatari@dreamscape.com>
Message-ID: <v1kkrl4n94972@corp.supernews.com>
Source record: 30000

I have a number of AtariWorks spreadsheets I've been using over the years. Now, I'd be just as happy to continue using them forever, but my Mega STe probably won't last that long, and I know my Syquest 200 MB carts won't. I've decided it might be best if I were to convert the 'sheets to a format my Linux/Windows PC can use, like Excel or OpenOffice.org, because if the worst happens it'll be easier to replace PC hardware than TOS-compatible hardware.

Is there a TOS, Windows, or Mandrake Linux program that can do this for me, or will I be forced to work them out by hand all over again? I thought of exporting them, but AtariWorks doesn't export the formulas in cells, only the results. I'm not interested in the formatting information, I can take care of that in the PC program I use. I AM interested in the cell references and formulas.

Any help I can get to ease my tax preparation will be greatly appreciated. <Grin>

Dear All,

I got a problematic atari 520ST for nothing, and I need some guidance on how to tackle it's problem.

The previous owner stated that it probably has a problem with a loose memory chip connection. Sometimes it boots to a white screen, sometimes it just gives a bomb. Is this a common fault, or is there a place I should look for it to fix? (have no idea what the innards of an ST look like - yet).

I'm a long (and still use) Amigas, but have never came across an Atari.

Provided I can fix that, I would also like to ask what kind of monitor I can connect to the ST. Does it have a video out? RGB?

And what about the hard disk connector. I would appriciate any info on how I can connect a hd on the machine.

That's all,
thanks for any info,
MrZammler

If something is hard to do, it'll happen.
If something is impossible to do, it'll just take a little longer...

Oh ye of little faith!!! If your Mega STE should fail just get it fixed or
get another one.

In fact, get another one now as a spare.

You have got other backups of your work?????

There are other Atari compatible storage devices besides the Syquest

There is another 10 yrs in the current Atari stock, let's have no more
bleating on this subject.

Grrrr!

I suppose what I should first ask is what would I need one for (cubase audio ??), and what sort of enhancments would it offer.

This would help me figurer out if I need one, that said, I wouldnt even know where to get one if they were still available. (though I'm guessing it must be a standard sort of chip used not solely in falcons.)

I live in the UK if this assists in location of a supplier

Thanks... Rob

I know the concern. I had to go to MS Windows because my Atari Mega STe 4 could no longer handle some of my VIP Professional spreadsheets. Just before the files were to big to handle it was taking 5 minutes to load the sheets and another 5 minutes to do a recalculation. I no longer have the STe but do miss the uncluttered way Atari installed programs. Most of the time a program consisted of less than 5 files, were all in one folder and if you wanted to remove the program, just delete the folder. "Gaud, how I love(d) it so! (George C Scott - Patton)

Getting back to those spreadsheets -
Because VIP Professional saved the files as WKS they were compatible with Lotus 1-2-3 which I now use. I believe WKS files are compatible with MS Works, probably Excel and others.

In those good ol days I was running the Bear Cavern BBS - It was a fun hobby and even got a few calls from around the world. Australia, England, Sweden, Germany... It added to the enjoyment seeing folks would call very long distance to visit my Atari Mega ST 4 BBS. I had three computers in those days, Mega ST4 for the BBS, Mega STe 4 for personal use and a 1040 ST for a spare.

Ah..... I'm babbling, us ol guys do that.

Take care all,

Don
Retired SySop of the retired Bear Cavern BBS, Vancouver, USA (State of Washington)

Source record: 30012

Excuse the post I dont make a habit of posting adverts on newsgroups but I have just shutn down an Atari Hardware business and I have 2 X Midi Adaptors for the Atari ST/STM range of computers. These simply plug into the 25 pin serial port and the Atari will recognise it as a 16 Channel midi adaptor. This has a 5 Pin Din socket output for standard Midi leads etc. It also comes with Cubase drivers on Floppy. Cubase is the only software that require these additional drivers.
They originally sold for £14.95 each (I actually manufactured them and hold the copyright) I have 2 left and anyone interested can have 1 for £5 This includes postage to the UK but overseas buyers will need to pay the actual postage. Probably only of interest to the UK buyer because of arranging payment in sterling. This is a one time posting, so sorry for the advert but I felt that this would be of interest to the many Atari users out there.

Every 520 ST I've ever had has strange problems like this, usually after sitting a long time. What usually fixes it is picking up the computer 3 or 4 inches and dropping it on it's left side. This serves to reseat a lot of the IC's in there. I am not responsible for any damage to your beloved atari ;-) This is just a technique that has been known to work.

Thanks
Mark

Source record: 30014

Hello,

Every once in a while, we get people sending me rather important documents that my wife or I need. However, they send them in MS Excel format. I hate it when people assume everyone in the world must use Microsoft stuff. I know that Texel supposedly can read Excel files, but whenever I try to import them on the Texel 2.2 demo to view them (File->Import->MS Excel), Texel just spits some German at me (it looks like something about it not being a correct file format). Is it just that Texel isn't up to date, and the newer MS stuff is that much different? Or am I doing something wrong? I don't have anything on my Mac that will read the files, either, so I'm stuck.

I am selling my Atari ST Collection (I collect pinball machines and full size video games and I am running out of room)

2 Atari 1040ST's (1 1040 has a PC Ditto 2 installed)
1 Atari Mega 2
1 105 meg Power drive hard drive (not homebrew, its a professional built product)
2 314 double sided drives
1 354 single sided drives
2 color monitors
1 R/C aerochopper
assorted cables, books, a few disks, etc......

$200 for all of it, or $150 and I keep one computer, a 314 drive, monitor, and aerochopper.

Please email me if you have any questions, interests, etc.......

Hi Mark,

> What usually fixes it is picking up the computer 3 or 4 inches and
> dropping it on it's left side.

You repair your car by dropping a hammer on its roof? =;-)

This is not a good advice. It's better and more professionel to open the ST and to drag out each IC, which is plugged in a soccket. Only one by one and remeber the position an direction of each peace.

When you drag the ICs, be very careful. Don't bend the pins of the IC

Then you rub carefully the pins of each IC on a peace of paper (normal paper for a printer does ist), then don't grab at the pins and plug the IC softly back in the socket (same direction as befor). Watch that all pins are correctly in the socket, then press it right down.

The pins of the IC oxidate by time so they don't have a good contact any more.

> I am not responsible for any damage to your beloved atari ;-)

The same for my advice. ;-)

You repair your car by dropping a hammer on its roof? =;-)

This is not a good advice. It's better and more professionel to open
the ST and to drag out each IC, which is plugged in a soccket. Only
one by one and remeber the position an direction of each peace.

When you drag the ICs, be very careful. Don't bend the pins of the IC

Then you rub carefully the pins of each IC on a peace of paper (normal
paper for a printer does ist), then don't grab at the pins and plug
the IC softly back in the socket (same direction as befor). Watch that
all pins are correctly in the socket, then press it right down.

The pins of the IC oxidate by time so they don't have a good contact
any more.

The biggest problem comes from chip creep caused by the thermal cycling. In
most cases giving the chips a good push down is enough to reseat them and
have no more problems for some time. Removing the chips and going through
all that hoo-haa only serves to increase the chances that the machine will
never work again, something that should be avoided even if it is an ST.

> I am not responsible for any damage to your beloved atari ;-)

The same for my advice. ;-)

After using Amiga's I think he is going to be sorely dissappointed with the
ST.

If it is room you are after you wouldn't be selling the Atari... it's not
that big.

try insert a DD Floppy.

connect an atari Hard Disc on that port or an Scsi convertor
connect an RGB monitor for colour
or an atari SM124 for high resoluton

buy a special cable
or find scematics to build convertor voor standard RGB

for better info refer ATARI ST FAQ

Hi everyone,

I have not tried posting before, so I hope I'm doing it right...
(although I *have* followed many discussions on this group over the
last couple of years and learned much of interest - thank you.)

I've been playing with Atari ST emulators for some time now, and
in my admittedly-limited experience, for use with "serious"
applications and relatively trouble-free setting-up, I'd go for
TOSBox any time.

I've installed quite a few emulators on various DOS/Windows
boxes for fellow Atari enthusiasts. Gemulator 2000 has nearly always
needed a bit of messing about because the program file I had to hand
has often not corresponded 100% to the docs to hand. Further, on
shutting it down and starting it up again, I sometimes found that
the first instance of it, had just minimised and was still running!
(This can cause some decidedly odd behaviour - in Windows 95, hit
Ctrl/Alt/Del to bring up a task list and see what's running.)

I wonder if some of the troubles expereienced are due to running
multiple instances of Gemulator 2000? Just a suggestion.

May I ask for help too? Despite the above "experience installing
emulators" I have *completely* failed to do one thing right - and
Murphy's Law tells you it's the one thing I *really* want to do...

Because of poor health I have wanted to use a better keyboard - my
STE's keyboard is quite difficult to use these days. It's soggy and I
make lots of mistakes, which as my hands shake take ages to put
right. Thus I hoped an emulator an a decent PC keyboard would help -
and it did. However, I mainly use my STE for e-mail and ftp - using
NEWSie - and after a year of fiddling have been unable to get STinG
to talk properly to my PC's serial port.

(Last year I changed my DMA chip, but my health has deteriorated to
the extent I couldn't manage to do that sort of hack now. So getting
inside and changing to an external keyboard really isn't on these
days. I *did* once try getting some DEC LK201s to work with my STE -
but despite following a FaST Club disk's instructions I never got
them talking to each other, although I *did* get the LK201s talking
to any and all of my DOS machines... :-( )

For the time being I use a DOS text editor and Ghostlink, preparing
email text on the DOS machine (with its lovely solid keyboard) and
importing it into NEWSie to send. But I'd like to do it all in an
emulator, especially as my STE's hard disk (an old SH204) is getting

iffy. I have a nice DOS email application but I'd really like to carry on using NEWSie - and all my other ST apps when the "real" Atari machine finally dies.

As I said earlier, I've had no real problem with getting most things working on emulators. Except STinG on a serial port with HSMODEM. I know HSMODEM is the problem because I've tried a "clean" emulator each time, using an emulator app, a TOS image, and an AUTO folder containing only the two components of HSMODEM (in the right order!). I've tried HSMODEM version 6 and 7, TOSBox, Gemulator Classic 3.8 and Gemulator 2000, five PC's - Windows 95 and DOS - and every permutation of can think of, of that lot - and every time the system "hangs" halfway through loading MFP.PRG; it doesn't quite get as far as displaying its "MFP without additions" line.

STinG pings its host OK, so STinG itself is working OK, I guess.

I even copied over my STE's C: partition to my PC's C: partition, and the known-working STinG/HSMODEM installation thus transferred, "hung" in exactly the same place...

I also tried replacing the two components of HSMODEM with TURBOCTS; this time STinG let me dial out, but the logs showed no responses to the packets sent. I got exactly the same result when I repeated this substitution on the STE - so I *know* HSMODEM is what I need to get going on my emulator(s). Well, I *think* I know...

If anyone has any ideas on overcoming this, I'd be *most* grateful.

Thank you, group members, in anticipation of any help given. Please bear with me if there is no immediate response from me to anything posted (assuming this posting of *mine* works...) as - although I collect posts regularly from comp.sys.atari.st - for the aforementioned health reasons I can't be sure of being able to respond to them as quickly as I'd like.

With best regards,

John

Well, as a matter of fact, someone *did* offer me a TT a while back. The SCSI interface isn't working, but he *thinks* the ACSI connector still will, with one of my ICD interfaces. Maybe I should take him up on it...

Oh, and I do have the work backed up, both on floppies and multiple paper copies. It's future work I was concerned about most.

144. ICD Link2 / SCSI 512MB Drive / Yamaha CD-RW configuration

Newsgroup: comp.sys.atari.st
Date: 2003-01-08 05:56:07 UTC
From: sean0ceallaigh@yahoo.com
Message-ID: <c6402c6a.0301072156.c561b3e@posting.google.com>
Source record: 30026

I've been testing my 1040STE hooked up to an external
SCSI drive with id 0 of size 512MB. The ICD driver software
boots up from drive C of the SCSI drive without any problems.
I have a Yamaha CD-RW SCSI attached to this external hard drive.

Problem: The ICD driver software does not see the Yamaha CD-RW.
It only sees the external 512MB SCSI. Here is the hookup:

1040STE --->ICD Link2---> 512MB HD ----> Yamaha CD-RW SCSI 2

When I run ICD check, it only scans the HD and doesn't mention
the Yamaha.

Any suggestions greatly appreciated.

Sean

Try the HD-Driver 8.1 demo on http://www.seimet.de. If it detects it the problem is that the old icd utils aren't seeing the drive for whatever reason, we may never know why ;-)

Basically I am selling all my old computer/home arcade stuff. It just doesn't get used compared to the pinballs and full size video games. I had ST's way back in the day, I sold them to buy pc's. Then 3 years ago, I got nostalgic and bought a local ST guy's stuff. I have had my fun and now I am ready to pass it on instead if it just getting packed away in boxes. My ST is currently sitting were I want to expand my PC network with another computer. We have a lot of LAN parties (starcraft/warcraft/Medal of Honor) and we are hoping to have 8 computers hooked together.

HSMODEM is meant to fix shortcomings in the serial chip of the
Atari. I am not at all sure you need it with an emulator on a PC,
as you will be using the PC's chips. So have you tried running
without MFP and SCC?

Regards, /Peter/

Hello Sean,

I would use HDDriver with your setup. Goto Uwe's site and download
the demo. I use in my STe setup that also uses a Link2 and
everything works fine.

>substitution on the STE - so I *know* HSMODEM is what I need to get
>going on my emulator(s). Well, I *think* I know...

I have runned STinG under Gemulator with success. The trick is to avoid
HSMODEM in the first place!

STinG itself does not really need HSMODEM to work and the serial port
routines in Gemulator does not suffer from the faults that HSMODEM
corrects.

Note that this was with an older Gemulator version and only worked with
STinG version upto 1.22. Newer versions of STinG failed under Gemulator
because of the interrupt handling that later STinG versions rely on to
function. Maybe this is fixed in newer Gemulator versions, I have not
tried it out.

I still have this harddisk image file intact and it does seem to work
well with the newest(?) Gemulator version. But I only tested to Ping
127.0.0.1 as I have no serial cable conected at the moment.

To get 115200 bps (or 57600, can't remember) check "Fast baud rates" in
the Gemulator properties dialog. This works similair to the Baud rate
mapping that HSMODEM can be setup to use.

Instead of the Rottengatter SERIAL.CPX use Atari's own MODEM.CPX and set
it to 300 Baud to get 115200 (if I remember correctly...).

With this setup I was able to browse with CAB and run Popwatch/Newswatch
for mail/News perfectly, all under Geneva/Neodesk.

I just rebooted my TT and I'm now running the latest 1.26 STinG without
HSMODEM or SERIAL.CPX installed. It's connected to the Internet via
Ethernet so it doesn't matter anyway, but there does not seem to be any
checks by STinG on startup for the existence of HSMODEM.

Sorry, but I'm to tired to setup and do a full test of StinG 1.26 with
the latest Gemulator at the moment...

Date: 2003-01-08 22:13:40 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <1042223118-32605AEicMi@adel6.freeserve.co.uk>
Source record: 29986

Hi Sean

>Does ASH sell Pure C and/or Pure Pascal to the US? Or
>are there any North American distributors in Canada or
>the US?
Bengy used to provide a North American version of the Europe Shareware service...but seeing as though he has disappeared the only option (for Pure Pascal) is from Pascal Ricard at Europe Shareware or ASH directly.

I ordered Pure Pascal from Pascal a couple of years ago and received my goods from ASH with no problems. The manual is in German BUT the program is in English!! Seems programmers speak the same language after all!!

>
>I don't speak German (although my Mom's family is from Bavaria!)
>So I can't figure out where ASH sells their products and
>whether there is an English version.
see above. The program is supposed to be compatible with Turbo Pascal (although not quite sure which version) which is handy because I have a reference book for v6 of this MSDOS program.

Hope this is of interest to you.

Neil

PS I gave up with the Megamax Modula-2 environment too! Couldn't get it to work properly with my Magic6.20 CT2B Falcon - must have been designed with ST/TT in mind?
3 Atari Systems:
Falcon 030 PowerUp2 32MHz/14Mb/1Gig/CD
Falcon 030 MkX CT2B 50MHz/78Mb/20Gig/CDRW
Atari Calculator (32 step recall!)

Gemulator appears to be hanging at the point where it looks for
drives. What drive settings/files are you using?

Hmmm. I don't know the answer to your question, but here's a few
things I'd try:

1) Gnumeric -- Atari might have used an already existing format.

2) Aranym -- Virtual machines can be fun.

3) Study the file as a text file -- perhaps a conversion is fairly
simple.

I use Atariworks spreadsheets frequently, but never bothered to export
them anywhere. I'll play around with it next chance I get.

>
> Mike Freeman
> nameerf@flash.net

Hi Mike,

This happens to me too, so I attach a quick letter in Atariworks
asking for them to resave as comma deliminated ASCII and to send the
new file. Once they email me saying they can't read my attachment, I
repeat the request in ASCII.

Galen

P.S.: Cheaper Mac applications, like Thinkfree (www.thinkfree.com)
can open Excel files. If you run OS X, Openoffice
(www.openoffice.org) also works. Texel only opens Excel 2, 3, & 4
files. Excel 2002 is very different (I think Microsoft does that on
purpose).

Nonsense! To clean your hard drive, remove it from the computer and scrub lightly with a plastic bristle brush dipped in dishwashing detergent. Rinse well, but do not submerge. Allow to dry completely before using as a paperweight. :-)

OK, so it's silly. But then again, so was the original post!

162. fVDI and NVDI problems!!

Newsgroup: comp.sys.atari.st
Date: 2003-01-09 02:03:50 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1042052658-531972AEicMi@williams-net.com>
Source record: 30042

Anyone,
I currently am running fVDI .959 beta and I have
NVDI 5.01 installed. I am using fVDI for my Eclipse 4
mb ATI Rage IIc graphic card. When I bootup under
fVDI all appears to be OK. When I bootup under NVDI
all appears to be OK. But when I bootup under both
fVDI loaded first then NVDI my internet connection
suffers BIG TIME. I am used to at least 5K/sec
download speeds and almost always falls between 3K/sec
and 8K/sec. But when booting up under both VDI's my
connection goes to way under 1K/sec. Does anyone have
an Eclipse that they are using with there Falcon030
and using both fVDI and NVDI??? If so, are you
connected to the internet with it??? If so, have you
had this type of problem and if so HOW did you fix it.
Thanks for the information in advance.

Thanks,
Carey Christenson

I hate in when a site is detonated with the intention of rebuilding, i think it would be much better to leave it as is, warts and all if any, and then plumb in the new site as its available.

What downloads are you looking for BTW?.

164. Re: Linux and ARAnyM

Newsgroup: comp.sys.atari.st
Date: 2003-01-09 02:14:41 UTC
From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0301081814.1c035187@posting.google.com>
Source record: 30044

I know I'm responding to an old message, but I think I might be able
to help clarify a couple of things. I'll try to make it
understandable from an Atarians viewpoint.

> Having read hear about ARAnyM, I've gotten interested in learning something >about Linux. Long ago, I learned that it was a command line OS like DOS, but >some work was being done on a graphical user interface. I have no idea where >this all stands when it comes to the Atari platform.

Linux is command-line based at heart (so is TOS, for that matter), but
most users also run a "desktop". For Linux, the most popular ones are
called Gnome and KDE.

> I've learned there are at least 2 "flavors" of Linux, GNU and Debian.

No. GNU is a policy that allows for the free transfer of code.
"Free", by the way, refers more to free speech than lack of cost,
although most GNU applications are in fact free of charge as well.
There are many flavors of Linux: Redhat, Slackware, Debian, Yellowdog,
and Lindows to name a few.

> ARAnyM uses Debian

No, although ARAnyM may have been coded on a machine that did. The
flavors of Linux are not directly compatible with each other, due
mostly to variations in which low-level programs the distributor
includes. Thus, if ARAnyM is compiled into a "binary" (think .prg or
.app) for Debian, it may or may not work on my Redhat installation.
However, ARAnym (and all GNU programs, I believe) include the source
code, and I can take that source code and compile my own Redhat
binary, since compilers for several popular computer languages are
included at no extra charge with each flavor of Linux.

> I'm really not planning on installing Linux on any of my Atari's

The only Atari Linux distribution I know of is Debian. I cannot get
it to install completely on my Falcon.

>I want a bit more speed I think. ... I had asked earlier here in
> the group a question of ARAnyM and Lindows compatibility.

I can't help you with Lindows -- all I know about it is that they have
some means to run Microsoft Office for Windows that appears to be
unique. I can say that running ARAnyM on a Mac is probably a bad idea
since ARAnyM uses a compiler that is x86 specific. Thus, ARAnyM will
likely be faster on a PC architecture. As for flavor, Redhat has the
largest US share, Debian has the advantage of generally being the

first ARAnyM binary posted to Sourceforge, and SUSE is (from what I can tell), a bit easier to get started on. Linux isn't really that hard to use nowadays, but if you want to go "under the hood" you'll have to do some reading.

If you have a spare PC, I'd buy a copy of "Linux for Dummies" or "Weekend Crash Course in Linux". They include a copy of Linux on CD. 64 MB of RAM, 512 MB free HD space and 200 MHz are roughly the minimum requirements unless you know what you are doing. Personally, I'd double all these numbers if you really intend to use Linux regularly.

Galen (who just took down his Redhat machine to free up a table on which to build a "SuperFalcon")

Yep...I wonder too.

Could be that the 'Atari' name is still well known in popular culture
and ilicits a curiosity outside the Atari faith. A stalgic thing.
Lots of publishers use names that incorrectly represent the purpose..

Do you connect to the Internet via a serial port?

If so try and lower the port speed to 57600 bps.

It sounds like your computer does not check the SCC chip for incomming
data often enough. There is a 1 byte buffer(!) onboard the SCC so the
computer has to do this quite often or you will loose data.

It's possible to switch the SCC chip to a ESCC with a slightly bigger
recieve buffer.

If using a HD image file check that it is not write protected. I had
similair problems to get Gemulator after copying everything from a CD-R.

The Windows operating system always sets the write protected flag when
copying files from a CD.

>
>The pins of the IC oxidate by time so they don't have a good contact
>any more.

It's even better to use a fibre-glass pen for this cleaning procedure. Such
pens are available for next to nothing in any electronics shop. With it
you'll really remove all oxides and can probably use the machine without
problems for a couple of years more - until the next time you have to remove
oxides... ;)
For the PLCC-chips (if they're socketed), you'll need a PLCC-extractor. You
might be able to use a small screwdriver - but the risk of cracking the
socket in the process is too big then - so a real extractor is a good
investment...

Best regards,
Claes

175. Mega ST4 keyboard

Newsgroup: comp.sys.atari.st
Date: 2003-01-09 12:14:04 UTC
From: Witchy <news@sruasonidyranib.co.uk>
Message-ID: <tkpq1vg0dqs1m9rkf19ob323co80f6qgnr@4ax.com>
Source record: 29954

Hi folks,

Temporary unemployment means I can at last check out some of me
museum's items and get them sorted/cleaned up etc. Yesterday I finally
found the lost DMA cable for my MegaST4 and eventually got it to boot
(without laser printer attached), however the keyboard just produces
garbage. The connection to the machine seems to be OK 'cos the mouse
works properly, so is there something obvious to check for keyboard
death?

cheers

witchy

Cool. Those big old arcade and pinball game machines still fetch a pretty
good price don't they? I remember seeing an old pinball machine sell for
$1000's at an auction a few years ago.

Regards,

Clockmeister.

Hi Claes,

> It's even better to use a fibre-glass pen for this cleaning procedure.

Yes, that's right. But if you have forgotten to buy one and need the
ST working soon, it is a solution with the paper, but the fiber-glass
pen is much better.

> Such pens are available for next to nothing in any electronics shop.

Or in car-sparepart-doityourself-shops. ;-)

> You might be able to use a small screwdriver

Yes, it works with a very small screwdriver, but it's risky and you
have to be veeeeerrrrryyyyy carefull!

> connection goes to way under 1K/sec.

Yes, I have both fVDI, NVDI and a Falcon, but I haven't experienced the drop in connection speed that you have. Two things spring to mind, they're probably irrelevant but you never know...

1. Are you running HSMODEM to give you the higher port speeds?

2. Have you set fVDI to be the 'background' VDI? I had to do it that way because I wanted the fonts and printers of NVDI, but it does slow down fVDI a lot. Whichever way you've got it, try it the other way - it might have an effect.

Source record: 29959

Got hold of an SMP24, want to use it as a multi midi interface for the Falcon (seeing as the midex won't do it) but as the instructions are in German, I'm having not the easiest of time getting used to it, can anyone help me out with english instructions.

Also, it came with an editor disk, that when run, seemed to work ok, and it does communicate with the SMP24 ok (so it seems)
I'll be checking this out on cubase very shortly, but is there anything I need to know, and will it function correctly...

I know you'll probably all just tell me to try it, and indeed I will do, but any advance information is always a bonus.

Thanks all........ Rob.

Chris,
Thanks for the response in comp.sys.atari.st. I am
currently running Iconnect. Do you need a HSMODEM
program in the auto folder??? I am running DRVIN.PRG,
SCC.PRG AND SOCKETS.PRG all for the Iconnect stack.
Is it necessary to have HSMODEM in the auto folder
with these programs. If so, where can I get this
program?? And why would it only affect my computer
when I run only fVDI and NVDI together?? And as far
as setting the VDI's to be background. Are you
talking about the order in which the VDI's are booted
up at bootup time?? For fVDI to be the Background VDI
I have to have it bootup FIRST in the auto folder
correct??

So it would look something like this:

programs previous to VDI's

fVDI.prg
NVDI.prg

programs after VDI's

Thanks for the help in this matter!!

That's OK, I think those programs comprise the HSMODEM package. I don't remember seeing a HSMODEM.PRG anyway. I thought afterwards that you must be running it otherwise you wouldn't have got the higher speeds in teh first place...

> And why would it only affect my computer when I run
> only fVDI and NVDI together??

No idea! But I've certainly had strange things with fVDI and NVDI. For example, Papyrus' Generate Report facility crashes when using both together.

> And as far as setting
> the VDI's to be background. Are you talking about the
> order in which the VDI's are booted up at bootup time??
> For fVDI to be the Background VDI I have to have it
> bootup FIRST in the auto folder correct??

Yes, that's right as far as I can remember. But isn't there a setting in fVDI also to tell it how to behave? I can't place my hands on the manual at the moment, but I remember a paragraph about it. It may well be that the order of the programs is all you have to do. What I was suggesting was to try it the other way around, whichever way you're currently doing it.

There are only shots in the dark, but I've certainly had 'strange' side effects of running fVDI, and together with NVDI, and I'm just reporting the type of things that solved my problems.

Up front, you did good. You put out some info I was interested in learning.

> Linux is command-line based at heart (so is TOS, for that matter), but
> most users also run a "desktop". For Linux, the most popular ones are
> called Gnome and KDE.

I knew about the command line basis, but it's been so long since I heard any off hand comment about Linux I was assuming the program was still command line driven. But after going to Mandrake's web site, I sure found out different. That's when I really started getting interested in Linux. More for fun, than anything serious.

> However, ARAnym (and all GNU programs, I believe) include the source
> code, and I can take that source code and compile my own Redhat

So.... Are you saying that it's likely that any distribution if Linux I'm likely to purchase will probably have a compiler included?

> > I'm really not planning on installing Linux on any of my Atari's
> > The only Atari Linux distribution I know of is Debian. I cannot get

How do you think it would run on a TT or a Hades?

> I can't help you with Lindows -- all I know about it is that they have

There appears to be some type of emulation going on. I found references to this idea on more than one Linux distribution website.

> If you have a spare PC, I'd buy a copy of "Linux for Dummies" or
> "Weekend Crash Course in Linux". They include a copy of Linux on CD.
> 64 MB of RAM, 512 MB free HD space and 200 MHz are roughly the minimum
> requirements unless you know what you are doing. Personally, I'd
> double all these numbers if you really intend to use Linux regularly.

I have a couple, as a matter of fact. After peeking at Mandrake's site, I thought about doing a dual boot machine. One of the spares is unused, the other is Win 3.11, so I won't lose much if things crash during the learning curve. Most of the time I'm using Win98.

I'm looking at Linux because I'm simply tired of supporting MS and all the virus concerns that never go away.

FWIW, I use Opera as my browser under Win98. Including reading newsgroups generally.

On standard Falcon Linux is terrible slow. On TT it chould be bit better,
Hades should be fine. TT-Ram should help too.

You can see my page about Linux-on-Ataris: http://atarilinux.atari.org. Any
comments welcomed.

Yes, but only when fVDI is the background VDI. That's the only reason I run
both, because NVDI slows fVDI down and therefore I wouldn't have wanted to run
NVDI too.

If Roger Burrows is correct (and I think he is), the problem is that a
CDRW can't be connected via a Link due to arbitration problems. A
regular CD can certainly be connected with the Link (I've done it),
and a CDR(W) can be connected to an Atari via other means (I've done
that too), but are you sure you connected a fairly modern CDRW with a
Link? If so, I'd be interested in knowing what model it is.

Uwe, if you are listening, can you add any clarification to this
discussion?

Galen

Okay, I've held my tongue as long as I could... and much longer than I thought I'd be able to.

If you don't like the magazine, for God's sake, don't frickin' read it. If you think there's more Atari news out there, send it to us. If you thing that there's something out there that nobody's talking about, write it up and send it in.

Otherwise, shut your goddamned mouth and stop wasting bandwidth.

And at least have the courtesy (you remember courtesy, don't you? It's what you evidently expect everyone to automatically give to you) to at least let us know who you are. Of course, there's only ONE person around gutless enough to bitch like this and do it anonymously, so I guess it's a moot point.

I'll tell you what... Stop sitting there expecting someone to do for you, and give something back... write a column, a review, or an article and submit it to us. Otherwise, stop annoying people.

Yep the pinball machines range from 500-5000.

The arcade games are actually starting to come down a bit in price. Usually
they
fetch 150-1500.

Hi Edward:

I purchased HDDRIVER 8 for my Falcon and really like it. I use it
with my Falcon and its external SCSI. When I tested it on my STE and
the Link2,
it was able to detect the external SCSI but not the Yamaha
CD-RW.

I believe what you are saying is that
host adapters like the Link2/Link97 do not provide
arbitration. CD-RW devices require arbitration.
So I could use my CD-RW obviously with my Falcon,
but not with a 1040STE + Link2/Link97.

I cannot really comment on CDRWs as I don't use one with my Atari. Fact is that any device that requires initiator identification (bus arbitration is more than that and is *not* provided by any LINK adapter, only initiator identification is) will only work with the LINK96/97 when connected to an ST/STE.

I would've thought if the cable was dodgy the mouse wouldn't work? I'm
going to open the keyboard up anyway just to see if there's any crap
stuck in there; it feels like the solid-circuit-with-carbon-contact
type keyboard rather than the squishy type found on normal STs so
it'll be easily cleaned.

cheers

I don't know about the mouse question, I have no idea which wires in the cable are used for what function.

And yes, the Mega keyboard has real switches in there. :-)

203. Stacy Power Supply

Newsgroup: comp.sys.atari.st
Date: 2003-01-10 12:58:33 UTC
From: carpethanger@yahoo.com
Message-ID: <d552133d.0301100458.734cd0c2@posting.google.com>
Source record: 29982

For anyone needing a new AC/DC power supply for their Stacy laptop, I happened upon one made by Koolatron - they make portable coolers for your car/van etc - and it works great. Not only will it power your Stacy, it will also of course power your portable Koolatron Cooler should you have one, and will also charge your car battery through your cigarette lighter jack!

Here in Canada the unit cost approx $45. Can be found at Can. Tire, WalMart, etc. I searched everywhere for an adaptor that would run the Stacy with no luck (Radio Shack, all manner of electronic supply companies, used computer stores, etc, etc, etc), but even the ones that should have been able to run it wouldn't. The Koolatron does.

Oh by the way. One WARNING here. I had to reverse the wiring on the cable for proper polarity/ground etc. (You will actually need a cable with a lighter socket on one end, and the regular a/c adaptor type jack on the other. I already had one. You can find this at Radio Shack etc.). Reversing the wires on it is very simple. Just unscrew/pop open the lighter socket end, and reverse the wires. There's even a fuse in the socket end for bit of extra safety.

Like I said, I searched everywhere and found nothing that would work and didn't want to spend $100US or more plus shipping costs on the real Stacy adaptor from Best Electronic or where ever. Can't justify spending that much on the old Stacy. Anyway, hope this helps someone in the end.

204. Reading DBF files (w/o an Atari)

Newsgroup: comp.sys.atari.st
Date: 2003-01-10 14:18:48 UTC
From: Frank.Poppe@zonnet.nl
Message-ID: <f65cb472.0301100618.3fde0369@posting.google.com>
Source record: 29983

Hello,

I have a couple of DBF files, which were probably created on an Atari ST using DBman. I myself no longer have an Atari, and have tried to read the DBF files.

Uptil now I haven't found a general Windows program that wants to read or import. I am willing to do a bit of programming, but the file description I found on DBF files does not seem to apply.

Does anybody know of a program that can read this files.
Alternatively, does anybody know of a description of the file format of Atari DBF files?

Thanks in advance,

Frank Poppe

205. Atari ST game support and requirement

Greetings,

I am one of the webmasters of MobyGames. Our goal is to document the entire history of videogames, put it in a relational database and make it available to the Internet community free of charge. So far we support the PC, most modern console platforms, nextgen (PSX, N64) and 3rdgen (dreamcast, ps2, xbox) and some classic system Commodore Amiga, Atari ST. 100% of the infromation in MobyGames is contributed by the users of MobyGames kinda like IMDB.

We would like to add the Atari ST computer platform. However we have had a difficult time figuring out the various technical requirements for Atari ST games and would like to enlist your help.

Please take a look at MobyGames http://www.mobygames.com and if you want to join the project email me at dberk@mobygames.com

This is what we have so far;

Atari ST

Section (dropdown list):
Minimum RAM required:
512 KB 1985
1.0 MB 1986
2.0 MB 1986
4.0 MB 1986

Systems Supported (check boxes)
260 ST 1985
520 ST 1985
1040 ST 1986
STE 1989
TT 1990
Falcon 1991

Section (checkboxes):
Input devices supported:
Keyboard
Mouse
Joystick

Section (dropdown list):
Maximum number of players:
1 player
1-2 players
1-3 players

1-4 players
1-5 players
1-6 players
1-7 players
1-8 players
more than 8 players

Section (dropdown list):

No, I haven't been able to try Dbase. I don't have (access to) a PC with
DBase on it...

Thanks for the offer for converting, but I better try around first.
There are quite a number of small files, most of them probably without any
importance. It would be a tedious task to convert them, while I would see at
first glance that they are of no importance for me.

It just so happens my posts display normally in just about every news
client as long as it's not really bad programmed. Unfortunately it seems
your client fails this simple test completely ;-)

And, I don't think it matters what sort of VDI you are running... :-)

Just about any databasse program should be able to read them. And some spreadsheets will also read them. Excel 97 for sure, I just checked the various file formats listed in the program.

Ken

Empty??? Hmm, it's about time you drop your crappy newsreader and get a
decent one.
Okami, Xnews, Fortï¿½ Agent, MacSoup, they all display Kenneth message
just fine.

> what has been there has been "over my head". <G>
Debian implies especially a type of the Linux program packages. It is
perhaps possible to install aranym on a not-debian-based Linux, e. g. Red
Hat.

> There
> seems to be 3 major Linux versions, Lindows, Red Hat, and Mandrake. There
> may be more, I
> don't know. But Lindows is the only on that is Debian based.
There are more Debian-based Distributions:
- Corel Linux (no more maintained since 2000)
- Xandros (successor of Corel Linux)
- Progeny (no more maintained since 2001)
- libranet (version 2 is free)
...
AFAIK pure Debian is difficult to install and the Linuces I mentioned
should be easier.
Corel and Xandros also provide a non-free Xwindows (Metro-X) that is
perhaps better than Xfree.

regards, Ludwig

Yes, you need HSMODEM for IConnect.

If you have an auto folder boot selector like XBoot you can easily try
different programs and running orders.

Cheers

Yes, that is how it works.

>I don't know about the mouse question, I have no idea which wires in the cable
>are used
>for what function.

The keyboard talks to the computer via a serial connection similar to how
a computer talk to a modem.

Both mouse and keybord "events" are transfered in the same way so if the
mouse works the cable (and most of the keyboard electronics too!) is OK.

AFAIK Gribnif still sells and supports their software, even if
new developments are not anticipated these days.

Dan Wilga of Gribnif has been good at replying to emails in the past,
and I would suspect you'll hear from him soon. If not, he might
see your posting here on c.s.a.s. (which I think he is reading
occasionally) and reply.

Sorted it - it looked like it had been the victim of spillage in the
past, so I dismantled as much as I could , reseated the controller
chip and gave it a bloody good clean.....it's now a happy keyboard and
I've now been able to scan the Megafile and find its one bad sector.

Can't get the laser going though.

cheers

witchy

226. mouse problems & how to open my ST

Newsgroup: comp.sys.atari.st
Date: 2003-01-11 15:48:32 UTC
From: Richard van Vugt <ricardo@euronet.nl>
Message-ID: <3E203CD0.6090005@euronet.nl>
Source record: 29902

Is there anyone who could help me with the following:

The mouse of my Atari 1040 ST does not work properly anymore. The mousepointer does not work, and doubleclicking only works after several clicks. I tried an other mouse but this one has the same problem. So, the problem must lie within the ST. I heard of loose mouse contacts in a newsgroup, so I want to open my ST and try to solve (solder) the problem. I opened the ST, and now I do not know what to do with the 28 tiny screws at the back of the keyboard print panel where at the back of it are the mouse contacts, I presume. Can I loosen them? Is this the right way?

Thanks for your help!

Richard van Vugt,

OK, here's my last comment on this matter. I promise.

Bottom line: The thing has "Atari" in the title and has about 2% of
actual Atari content.

Now, somebody PLEASE write a retort that refutes what I've said in the
previous sentence. You can't.

This is just too much...you actually ADMIT to the fact that you don't have enough Atari news to do a full mag! Howver, you still see no problems with using the Atari namesake in the title! Unreal.

And please don't tell me about "contributing" - I've written more Atari-related articles than I can even remember, including publishing my own Atari newsletter back in the day (which was 100% Atari content and distributed monthly to a several-hundred member local user's group). Believe me, I've contributed to the Atari community, sir.

I apologize if I've offended anyone in the group. Enjoy your non-Atari reading, folks...

I know you've never been a fan of "Newsie", but why, after all these
years of good service, should Kenneth's messages give it problems ?
Never had this problem before with anyone else's posts.

Cheers

Paul

I use PP as well. Got mine from System Solutions in GB. I found
a free Turbo Pascal refernce book on the web. Good enough for
referencing the odd function.

I found PP doesn't like the Mint/Thing multitasking environment
and so I have to use TOS or just manually call the compiler.
I haven't figured out how to call the compiler from an editor
like Everest.

You might also want to try the Object-GEM library by Thomas Much.
I think it was used to write CAB and a number of other commercial
apps.

PP seems to support the Object Pascal functions used in later
versions of TurboPascal.

Peter

232. Video grabbing

Newsgroup: comp.sys.atari.st
Date: 2003-01-11 19:59:06 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3e20778a.0@entanet>
Source record: 29908

Hi all,

I've been playing with the video grabbing function in the Funmedia
demo and GEM-TV

I can manage to grab video but there are one or two problems. I wondered
if anyone else had tried it.

* at low frame rates (< ~8fps) nothing is recorded
* only 8 bit mono sound can be recorded
* with 8 bit mono the left channel is white noise

Some of these problems may be because the required data rate is
faster than the Milans IDE interface.

Also, I frequently need to restart Funmedia or reboot.

Are there are any other apps that can grab video from the screen
and write it to disk along with sound ?

Regards,

Peter

233. Atari USB

Has everyone read the article on Atari USB on MyAtari ?

It seems like the 8-bitters are going to get USB yet there
seems to be no plan to get it on the ST/TT/Falcon/clones

Has anyone done any research into the feasibility of
connecting a pci USB card to an Atari ? I believe the Coldfire
project includes USB, maybe they have started work on drivers.

From what I understand two pieces of software are needed; a low
level USB driver and a driver for each device. I don't know much
about low level software but would the USB driver be a vdi
extension ?

I don't think it is a particularly complicated standard, maybe
there is some open source software that could be ported ?

Perhaps some sort of competition could be launched with the
prize going to the person or group that successfully demonstrates
an unmodified USB peripheral and card working on a 680x0 machine
running TOS, Mint or Magic.

We don't exactly need a USB mouse or keyboard so it might be worth
making it a bit more of a challenge by excluding these peripherals
or awarding a second prize.

What's your opinion ?

Regards,

Peter

Hi Mark

> Recently I have acquired a Matrix VME video card. These things are
absurdly
> expensive so I hear and are a professional card.

Tell me about it, i paid 200 quid for my Mega-vision 256 colour for my
Atari, and in comparison my PC's 64Mb multi MHz True colour card is about
the same price!!.

> Problem is I don't know *which* type of Matrix card it is, nor do I know
if the large board
> attached to the top is for debugging a hardware problem (as the story

> at these pictures and give me a little background info?

Its a memory expansion ontop, allows TrueColour modes to be used as well as
256 colour max.

Personally I would not mind a PCI USB card for my Hades060, but I
do not think that will come. I am looking forward to getting via
the Coldfire computer. Having a USB port on my Atari would certain
open alot of doors.

I hope everyone had a great holiday and new years! Despite the lack of
updates over at http://www.ataritimes.com, I've been very busy working
on and distributing the 2002 Year End Issue. Updates are again beginning
to trickle onto the site!

Here's what's new at Visit http://www.ataritimes.com this week:

* NEW! Updates to the 2600, 5200, Atari ST,
& Arcade game review lists
* NEW! Review of Jaguar Zoop
* NEW! Review of Lynx Rampart
* NEW! Introduction of PopGem
* 2002 Issue Now Available!
* New "5200" theme in place

As always, The Atari Times is always on the lookout for writers! Visit
http://www.ataritimes.com/writer if you are interested in getting paid
for your writing talents!

With the phrase "something wrong with the format", do you mean that possibly the files are corrupted.

Corrupted files is another possibility.

Do you know what is in the files? Do you have a sector editor where you can look at the bytes in the files?

Thanks! Ed,

Works great on the STTOMSA side!
No problems creating an MSA.
BUT
When I transfer files from a Win98SE machine to a 720K Atari formatted
disk, the disks become "damaged" when I try to run the program on the
Atari.
I've had this problem ever since upgrading from 95.

Any ideas?

I got 2 brand new never used PCI ethernet cards.
Both of these should work in a Hades as the chipsets are clearly
marked with the chip numbers needed by Odd's drivers.
They might work in a Milan too.
The first card I bought mail-order had the wrong chipset numbers,
however as it turns out it works with Odd's driver and I bought these
other 2 just in case. This was before the driver was actually completed.
Anyway I don't wish to throw them out.

ASOUND 10/100Mbps Fast Ethernet PCI NIC
D-Link 10Mbps Combo 32-bit Ethernet PCI NIC

Make an offer, I'll take it!
Just add $5 for S&H anywhere in the US.
I do not wish ship to outside the US, sorry.

Please note the title contains 'etc', please look that up.
'et cetera' phrase meaning "and the others"

Perhaps it's interpretation but it appears covered in the title to me.
So you don't like it, I don't think he should change the title just
because the Atari section has gotten smaller over time, or because
you think it's wrong.

> This is just too much...you actually ADMIT to the fact that you don't

Probably more along the lines of gemdos, since it's device i/o
oreinted my guess.

> I don't think it is a particularly complicated standard, maybe

If you have a clone you are like over halfway there, you just pop in a card
and it becomes a software driver issue. It's my understanding there are
some common base level usb device that don't need drivers. An example is
a digital camera. You buy it, install nothing, yet when you hook it up
it automounts. If we could at least do that it would be nice. ;-)

Hello,

I am trying Copyist Professional-DTP with Magic 6.x and NVDI.
(Falcon 030 - HDDriver 8.04)

Everything seems to work alright until I try to save my file.
When I select save as, I get this error:

Memory Block Destroyed by User Program
Address of MCB: $0011A154
Data of MCB: $00000052 $00000000 $00000000 $00000064
System dump to disk:

My guess is that Copyist doesn't like Magic's file selector.

(This doesn't happen under TOS/NVDI)

Any suggestions?

Thank you in advance.

ken

look at the gfx chip, if it was a
texas instruments "TMS 34020" it's a
TC1006 (1 Mb of video ram)
or a
TC1208 (2 Mb of video ram)
like mine on the TT

```
if the gfx chip was a "intel 82786"
it could be a
Moco (mono) (256Kb ram video)
Coco (256 color) (1Mb ram video)
Mico (mono+256 color) ((1Mb ram video)

matrix C32 and C110 are for mega st only
(intel 82786 chip too)

Hi,

I have just released
YSEDITOR PLUS version 2.71
YSEDITOR V50 version 3.31
YSEDITOR FB01 version 0.82b

New in this little update: It's now possible to import SysEx dumps in
Standard Midi File format (.MID), in addition to the many different file
formats that were already recognized !

255. Re: Reading DBF files (w/o an Atari)

Newsgroup: comp.sys.atari.st
Date: 2003-01-12 13:16:46 UTC
From: Frank Poppe <Frank.Poppe@zonnet.nl>
Message-ID: <3e216ac0$0$49110$e4fe514c@news.xs4all.nl>
Source record: 29935

I meant that the format does not seem to follow the standard. Perhaps they have been produced by some other utility then I thought.

I have had at a look the file on byte level.
The files look structured, with a header defining fields, and then the records. But without a definition of the format it is difficult to find out what exactly the structure is.

It certainly does not follow fhe DBF definitions I found at http://myfileformats.com/.

Thanks,

Frank

As said only those with a bad newsreader are affected. For pc there are
much better newsreaders then Outlook. Outlook can't even place a working
signature separator. Most of then are free to use.

It rattles around in my brain that somewhere I ran across a program that created files with the DBF extension, but they weren't database files.

I had hoped that a byte level look at the file would give a clue. The first 2 bytes of a Word Perfect document file was WP, at least up through version 5. Something like that was what I hoped you would find.

Since I've got these old Ataris, I thought it would be fun to put together a Windows for Workgroups 'puter too. Working on that right now.

And for this WFWG computer, I've got Norton Utilities 6.02 and PCToolsa 7.1. Both offer built in DBF file recovery routines. I could run those files through them if you would like.

Sure!

This should not happen as an UUE attachment should begin with a line:

>begin 666 name-of-the-file.ext

(I have put a character at the begining for the line not to be seen as
an attachment :-))

and should end by the word "end" on a sigle line.

Bye,
/Pascal/

Hi Ken,

> My guess is that Copyist doesn't like Magic's file selector.
> (This doesn't happen under TOS/NVDI)
> Any suggestions?

I think the program is not made for multitasking, so try the MagiC
single-modus. The program writes in an memory block, that didn't
belong to this program. Under Tos this dosn't matter.

And if you want to check out another fileselectbox, then you should
try boxkite <http://www.netcologne.de/~nc-beckerha3/>.

Gruß Harald Placke

Agreed, but with Newsie things are a bit different. A pity that Newsie
also share the same imho lazy way of doing things with OE.

You simply can't assume that any text that starts a new line with begin
followed by two spaces is a file! Other newsreaders do this in a much
better way.

But, as Newsie is not supported any longer(?) and there is no real
alternative for lower end Ataris I have reverted to a more conservative
way of citation.

Btw, I can't get the *.QFM file in Okami ta behave exactly as I want. The
"quoting instruction":

swnet.* telia.* se.* tripnet.* Mail.kennethm|*.se *.telia.com *.bip.net
ur %g\nbegin citerad text frï¿½n %m\n av %r %Z:\n
\end

should trigger on email addresses from anyuser@telia.com but it does not.
What am I doing wrong?

There is no *.DBF file standard so nothing to follow... It's probably a
data base file, though.

Only a few file extenders are standardized like *.HTM for html and *.DOC
for 1stWord+ :-)

On the other hand the Swedish 1stWord+ actually uses *.DOK without some
of the code being aware of this fact!

Okami should work on lower ends of Atari's too. Newsie is not good. For
instance Newsie postings which holds chars above ascii 125 are hard to
read with non-Atari readers.

There's plenty of 3rd party fileselectors that you could try, maybe you could also try running in Single mode as a test, its possible multi tasking is making it barf.

I posted to make the user aware of a possible problem, it seems to have
started a bit of a flame fest, I'm glad at least it's not just me that has a
problem.

I don't have a digital camera but it would be very nice for those that do.
Is the same true of those cheap little webcam's or do they rely more on
host software ?

I am reading this message loud and clear, have you made any alterations, i certainly haven't.

I posted my original message ref this just to make you aware of a possible problem, it seems to have started a bit of a MCIBTYC thread though with people bitching about mailers...

I'm glad i can now read your input anyway.

There is a template device driver in FreeMiNT sources, but you still have to
adapt Linux driver to it.

But, from what i know, USB may require some kind of "stack", but I'm not
sure. So you would have to write such stack too.

273. Webcam jpg

Newsgroup: comp.sys.atari.st
Date: 2003-01-12 21:21:00 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3e21dc3c.0@entanet>
Source record: 29848

I was just looking at a webcam (a view of Lake Tahoe USA).
The image (~700k) claimed to be a jpg but it didn't display
in CAB.

I tried opening it with Imagecopy and Aniplayer but they
didn't recognise it either. Curious I had a look at the
file header which looked like this:

--ThisRandomString
Content-Type: image/jpeg
Content-Length: 7130
Pragma: no-cache
Expires: Fri, 01 Jan 1983 00:00:00 GMT

����
JFIF

The JFIF like suggested it *is* a jpeg so I dug further. I have
a program I wrote to extract jpegs from within Powerpoint files
so I ran it on this webcam file. To my surprise it extracted
27 jpg files, I think it only stopped when my simple program
ran out of legal filenames.

These 27 files all open and display slightly different views
of Lake Tahoe. They are each about 7k. Using the slideshow
function in Imagecopy I was able to view them as an "animation".

Is this a common form of animated jpeg ?

Is there any other way of displaying it without having to manually
extract the images ?

It would be nice to be able to see each image while it is downloading
but that is probably asking a bit too much from CAB. Maybe Highwire
one day ?

Most newsgroups are not moderated at all and this group propagate (almost)
anything you post.

The only moderated Atari newsgroup I'm aware of is
comp.sys.atari.announce and the moderator is Kevin Savetz
<savetz@northcoast.com>. All posts to that group has to be approved by
him before they go out which means both a delay and some work for him.

That's how moderation works in newsgroups and possibly the reason why not
more groups are moderated. A group with normal traffic would be a
fulltime job for the moderator so it's out of the question in most cases.

90%+ of ST games were written with the 512K ST series in mind. There
are a few STe and Falcon specific games and a few 1MB or 4MB required
games in the 1990s.

Roughly 2/3 of ST games run on the Falcon, and
http://www.atariarchives.org/cfn/06/03/07.php provides nearly a
complete list of those that work. I do not have hard data on the TT,
but I seem to recall that few games were ever tested on it, since TT
users generally do not play games on their machines.

I would think it would make the porting easier, that is partly why mint is
way it is. ;-)

The webcam I have required additional drivers. The thing with the camera is
that it mounts it like a pc formatted disk. Cameras work entirely
different.

>mousepointer does not work, and doubleclicking only works after several
>clicks. I tried an other mouse but this one has the same problem. So,

After years of unplugging and replugging mice the socket's solder joints
fail, giving the problem you've outlined.

Using the right-sized screwdriver you can unscrew all those little screws on
the underside of the keyboard (peeling back the sticky plastic film where
necessary). Once you've done that you can lift the circuit board off - noting
that some keycaps will stay stuck to the board.

Once you've resoldered all the connector joints you can reassemble the
keyboard. If you made careful notes when lifting the back off this will be
easy, if not you'll have to be careful because there's an extra contact pad
which doesn't have a matching key IIRC.

HTH - it's a DIY job if you know which end of a soldering iron gets hot ;-)

Cheers

Derryck

Such a driver does not exist, at least not for IDE drives and depending on what you need in particular it's also not available for free for SCSI drives. 3. (as far as IDE drives are concerned) and 4. (depending on the partition type and size) are only available with HDDRIVER, which is commercial.

Hello,

You probably get this hundreds of times, but been out a while. I am trying to archive all my 720 disks on CD todo this I have to transfer them over to my PC however for the older disks it seems to have trouble reading them. Is it possible to transfer them another way by printer / serial ports. Or is there a program out there to read 720 single sided disks? My PC is running XP and I own a Falcon. I understand that it is possible to transfer via serial ports but that the speed is only 19,200.

Thanks for any help

shin

Boris,

Well this is all very helpful. So it is a Mico with truecolor expansion.
ANyone know if this board will work in a mega ste without modification?
I'd like to keep the TT in a tower case without breaking anything (since it
seems to be so sturdy and reliable. My mste however is already in a tower
case.

And when you find you are one rubber cup short, check the large return key.
It has room for two cups but only one is used...

289. Aranym and MiNT

Newsgroup: comp.sys.atari.st
Date: 2003-01-13 16:54:24 UTC
From: Jerry Cornelius <jc@msn.com>
Message-ID: <avuqvs0cv7@enews3.newsguy.com>
Source record: 29864

Hello,

Here's a question for the ages... Since I've never been in a position to use MiNT (I have a Mega2 ST with a single hard drive), I thought I could download Aranym and then look for MiNT and try to install it using the 100MB disk image.

I'm trying to use EasyMiNT, since it appears to be the easiest and quickest solution. However, it needs to install on a Linux or Raw partition. It's been a long, long time since I've done much with my ST and I've never had an IDE drive for it so I'm at a loss as to how to create such a partition. Aranym's disk image comes with a version of Cecile, but I can't create any kind of partition besides BGM with it.

Anyone know how I can do this?

Thanks.

>new news reader, or changed any settings?

No, not really it's all about what text you write yourself in the text
area of the message. A line that starts with the letters "begin "
anywhere in the text will make OE and unfortunately Newsie think there is
an uuencoded file coming. Very sloppy programming, really.

More details at http://www.rodos.net/outlook/

I'm still using this feature in some more general newsgroups where OE is
dominating. To my surprise people get angry on me because there programs
can't read my articles. Very funny how they react on things they havn't
read :-)

Hello,

> 2. Can handle all types of Atari interfaces (IDE, ACSI, SCSI)
> 3. Can handle big disks (20GB+)
> 4. Optionally supports PC partition schemes

I worked with CBHD5,02 and enjoyed it for years, but when I bought a wd20 Go
it only allowed me to use 4 Go of it.
I bought HDdriver 7,84 that didn't worked with my computer (fat and dir never
correspond but no write nor read errors, and DIR was correct) then I had to
go back to HDdriver 7,01 that came with my computer and always worked fine.

I read that last versions of HDdriver had no trouble with everythings, even DVD.

You should buy HDdriver, it is not that expensive, and with buying the software
you allow the author to continue to make newer versions.
REMEMBER STARBALL : the author of that great flipper warned that if it wasn't
enough registered people he was moved to PC ... and he did he didn't even send
me the final release when recieving my money).

Message-ID: <BA4869FF.2952E%nameerf@flash.net>
Source record: 29871

Hello!

Does anyone know if any of the E-Mail programs for the Atari can work with SMTP Authentication? Since my ISP was bought out, they now require that. I normally use aMail, but it doesn't seem to have anything for that, and I haven't seen anything like that in Newsie. I use MagXNet, which doesn't seem to like MyMail (at least on my system), so I don't know if that uses it or not. Any suggestions? Otherwise, I cannot send e-mail from my Atari, which is how I currently get files transferred between my Falcon and my iMac (no Ethernet and no Floppy on the iMac, so I e-mail files to myself). Thanks!

I am not sure if the ISA slots in the Hades are supported for ethernet.
That chip number I do not recall, my guess is no unless it is compatible
with the other chipsets that are supported.

Go here for some useful sites with drivers and such:

>_you_ think it's wrong.

Lonny,

You hit it right on the nose, including the "Etc." interpretation. Everything in the title of our magazine is included in the contents of the magazine.

In the old days, I'd really take this guy to task. But, I've gotten older and wiser over the years. What's worse, he hides behind an alias. It's not to him that I really care to respond because if he had asked his question in a responsible manner, I'd reply in kind. It's to those who might read his garbage and take it to heart that I'd really like to address.

>> This is just too much...you actually ADMIT to the fact that you don't
>> have enough Atari news to do a full mag! Howver, you still see no
>> problems with using the Atari namesake in the title! Unreal.

Why would I pretend that there's plenty of Atari-related news out there to report? And what makes this person think that even if there were a lot of Atari news that everything else we include in A-ONE would disappear? Far from it. This has been our format from the beginning, and the format from our roots with STReport. We happen to like the fact that we don't just report Atari news. Atari users are unique. Not only do they follow their passion for their chosen platform, but are inquisitive enough to want to know what else is going on in the technology world around them. For many of us, if not most, we use other platforms as well as Atari.

>And Infogrames ain't using the Atari name for marketing strategy?
>Why not write them and bitch? What do they do for the computer line?
>Absolutely zero but they use the name. Is that fair?

What does "Time" magazine have to do with time? It's a name folks - only a name. If there were never anything Atari-related in A-ONE, I'd consider this a "legitimate" comment about our name. However, there is plenty of Atari-related stuff in our magazine on a weekly basis.

>> And please don't tell me about "contributing" - I've written more
>> Atari-related articles than I can even remember, including publishing
>> my own Atari newsletter back in the day (which was 100% Atari content
>> and distributed monthly to a several-hundred member local user's
>> group). Believe me, I've contributed to the Atari community, sir.
>
>That's cool.

And your point is? When was that, back in the late 80's or early 90's? I've been there also. Did our user group's monthly newsletter for years, written for some of the best commercial Atari paper mags of the time, worked on planning an AtariFest in Boston, sponsored meetings with Atari, been to numerous WAACE & CT shows, and more. So did many of us. Atari news isn't what it was back then (and that isn't saying much!).

>> I apologize if I've offended anyone in the group. Enjoy your
>> non-Atari reading, folks...

We will, thank you.

>My advice is killfile certain posters or learn to skip posts.

That would be too logical. The guy has already stated that the purpose of his original post was to cause trouble because he enjoys doing so. He has nothing pertinent to contribute.

306. Steinberg SMP 24 - 220v (UK) to 110v (US)

Newsgroup: comp.sys.atari.st
Date: 2003-01-14 04:34:00 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <7cMU9.11433$WT3.6613@news.bellsouth.net>
Source record: 29887
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I recently recieved an SMP 24 that I purchased from the UK. I'm in the US. The back of this thing seems to illustrate that it will work with 110 or 220 v by only changing a fuse and the cord. I can't seem to find any switch or anything on or in the unit. I only noticed a yellow wire left unplugged, and nothing attached to what here in the US tends to be the ground pin.

Powering up causes the little cricket speaker inside the thing to just whirrrrrrrrrr as the number read-out flickers.

Do I have to change the powersupply? Cross some wires?

Any help would be muchly appreciated.

Thanks,
Brian

307. Copyist - Not what I thought

Newsgroup: comp.sys.atari.st
Date: 2003-01-14 04:42:40 UTC
From: Ken Kosut <kjcat@shell.voyager.net>
Message-ID: <Pine.GSO.4.44L0.0301132232200.13533-100000@shell.core.com>
Source record: 29888

Hello,

After all of the agony of trying to set up Copyist,
I am very disappointed.
The program is just to dated and cumbersome.
I am sure it was very nice for its time.

I imported a 16 track midi file into Copyist.
It takes forever to load. Screen fonts look scraggley.

Tried the same test with the demo of Score Perfect Professional.
Quick loading, plays the file, screen fonts look great.
Looks like I can edit very easily what my sequencer cannot do.
And best of all it runs with MAGIC/NVDI.

Does anyone know if there is a demo of SharpScore?

thanks

ken

You won't find anything for this purpose... It's quite unusual to add a
hard disk driver to a software package. Why do you want to do so instead
of just recommending the users of your software to use drivers with
certain features?

The OP must run HSModem from his Auto folder for reliable results at this
speed.

An alternative is PARCP as Yves states, I do not know if it will run under XP
though.

A possibility might be to copy single to double-sided disks on the Falcon,
and see if the PC will read those.

I would have thought that most if not all SMTP servers would require a login
name and password, or is this a different thing?

In NEWSie these entries would be in "Personal Information" and "Mail Reading
Options" respectively?

Cheers

Hi.

The same box is used for the 220V and 110V models.
I opened mine and had a look; sometimes it is only a matter of moving a couple of wires. (I did this to my 110V Roland D50)
Open your unit and have a look at the area between the transformer and the fuse. There are 6 of solder points connected to various points in the power supply. There is a jumper between two of them.

It looks something like this: : I :

I am not sure, but you could perhaps try to remove this jumper and solder new ones on the unused places.

Like this: I : I

Of course, this may cause the whole thing to blow up as I haven't tested it.
I take no responsibility for this at all. Try it at your own risk.

A common misconception is that any mail that you send has to be
authenticated. The standard SMTP protocol does not require any authentication
at all. Only acquiring email (with POP, for example) does require
authentication.
Netscape and Outlook, for example, use standard SMTP and send their email
without authentication. This is the reason why it is very easy to fake
"from:" addresses and the like, and why you can principally send email using
any SMTP server.

Hi Michael,

> Does anyone know if any of the E-Mail programs for the Atari can work
> with SMTP Authentication?

This is a job of the TCP/IP-Stack, but non of the stacks for Atari
supports this.

> Since my ISP was bought out, they now require that.

Perhaps your ISP offers also "SMTP after POP", when using this, you
have to look first for new email, than you can send email.

> Any suggestions?

If you speak german, then you can use CAT and In2Cat, with this
package you can use SMTP Authentication. Sounds intresting?

I recently bought one of these from Germany, and I live in the UK. I wondered the same (and the instruction manual was in German, so that wasnt going to tell me) So I just plugged it in and it worked.

I don't know what power supply they have in germany, but it was a two pin plug so I had to change that, but when I checked the fuse on the back, the right was in.

Hope this helps.... Rob

Hi there,

The ongoing developement of MyMAIL contains parts for
SMTP Authentication but no one of my testers or myself has a ISP
that supports that.

Cause of this it is not completed and are untested.
Parts in RFC2554 (Only DIGEST-MD5 are supported)
and parts of RFC2487 (TLS) is added.

If anyone likes to help testing this do give me a mail
to erik.hall@affv.nu

325. Using Cubase with MultiTos (falcon)

Newsgroup: comp.sys.atari.st
Date: 2003-01-14 15:11:37 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <jq982vov0dv7lvgvd09a6e57nha71ll0ad@4ax.com>
Source record: 29806

Hi..

I recently requested from this group that someone email me the system floppies, and a couple of people kindly did.

I have since installed most of this on the falc, and the new appearance of MultiTos, I'm very pleased. I also installed a number of the other acc's.

When I tried running Cubase I got the message that MROS could not be found.
One by one I tried iliminating the new programs, until I stumbled across the "protected memory" option in the MultiTos setup (within XControl).
When I switch this off, Cubase runs, is it OK to run the computer like this.

This thread has got me interested. I shall have to have a look at your website later, maybe it will answer some of my questions.

I wonder if anyone has Linux on a Hades or Milan. Is a dual boot with Mint possible ? Obviously access to TOS will still be possible.

I had the silly idea of sticking Linux on a spare partition so that I could run a Java/Javascript browser. Would I have to compile it myself ? I know it would be slow on a 68060 but I was only thinking of using it to configure a broadband modem ! If it will be a massive task to get a browser running then obviously not worth it.

I know I could get an old Intel box but space is a bit limited here.

regards,

Peter

I don't know the answer to your question and I surely hopes my ISP
doesn't do the same. My ISP already ask authentication for NNTP. Until
recently I was unable to post message to Usenet using my beloved
Newswatch/Okami combo. For some reason authentication failed although
Newswatch can handle authentication.
Thanks to Kenneth who pointed me to a free to use newsserver I'm able to
post again.
I'd like to make one remark. Mail isn't the right tool to transfer
(large) files. You can compare it with using a sledgehammer to knock a
nail into the wall.
There are much better tools for that task like for instance "ftp".
Most ISP's provide webspace. Why don't you use that? Just ftp the files
to your personal webspace and there you go.

HTH,
Martin

And ofcourse "top".
A common MiNT installation doesn't hold "top" and other usefull tools.
IMHO, top and thelikes commes with a MiNT-net distribution kit like KGMD.

332. Texel 2.20 English patch

Newsgroup: comp.sys.atari.st
Date: 2003-01-14 17:49:14 UTC
From: <>
Message-ID: <1042563022-313635AEicMi@ntlworld.com>
Source record: 29809

Hi all,

I'm nearly ready to release an English patch for Texel 2.20.

I would like to hear from anyone who can beta-test this for me before I put
it on my web site since I'm no spreadsheet expert - so persons familiar with
Texel only, please.

Cheers

Derryck

Latest version of PARCP has support for NT family (NT, W2k and I think XP)
included.
I have only used it on W2k though.

Nospam is a little utility from a French Okami user Pascal Ricard.
It change your regular e-mail address into a anti-spam e-mail address.
For instance <lars@what.ever> into <nospam@what.ever.invalid>.

As the German newserver requires a working address I use Nospam to
change my regular address into my e-mail address of my free ISP account.

OK, I was hoping for some fancy active spam filtering application taking
advantage of online reources with known spammers "fingerprints".

I have not checked this is detail but such a client would be cool.

Yes!, Yes, i have used it myself, it is as you say, a launchpad, saves a
hell of a lot of searching.

Keep it up is my opinion.

You are telling us alot about your hardware setup but nothing about which
tcp/ip stack you are using??

If your transfer speed goes down first check if ip packets are dropped
because of wrong checksums. If they are it may very well be because your
computer spend too long time in supervisor mode so it does not fetch
incoming data on the serial port fast enough.

I've seen this happen with STinG when running Geneva/Neodesk on my TT and
because of a poorly written SM194 bigscreen driver on a Mega4. MIDI ports
are even more sensitive to this.

lp,
I am running Magic 6.10 with Jinnee 2.5 and NVDI
5.01!!! If this helps?? As stated before, I am
hoping for a Control Panel or APP that tells me
processor load on the current apps running at the
moment and some possible breakdowns. Although this is
not necessary I suppose. I am trying to find out whe
I run fVDI and NVDI together if one or the other is
putting a strain on my processor. Because my internet
connection suffers greatly when running both at the
same time. When I run fVDI or NVDI alone I get in the
neighborhood of 4 K/sec on up to as high as 9 K/sec.
When I run both at the same time I get well under 1
K/sec and this is not exceptible. Thanks for the
feedback.

Thanks,
Carey Christenson

Yes, and it can be found many places. You really only need mint.prg and
top.ttp, that's it. However, it would be nice with a small GEM-application
similar to the process-manager in NT/Win2K.

343. What Is MINT

Newsgroup: comp.sys.atari.st
Date: 2003-01-14 23:34:40 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <p2792vc7qnea88pitc10ea0iaj151rte9v@4ax.com>
Source record: 29824

I'm expecting a few replies to this one.

I've tried to improve the software capability of my Falcon (standard case with no speed improvements if that helps - though 16mb of mem) I installed the multiTos app off the system disk that someone kindly sent me, only problem is, It's kindly locked up Cubase for me (It can't find MROS, and won't run without it)

I've been looking at alternative operating systems / desktops (as I do like the improvements that MultiTos gave me) and one of the things I've noted is that when booting up, the computer says Mint is now TOS.

I'm thinking since 1992 / 1993, there must have been improvements to the version that was distrubuted with the falcon, so having searched the net for "Mint AND atari", I find a lot of (what looks like complex) information about Mint, about installing it and about programming for it, but no simple, "this is what Mint does" (in Newbie language)

So, can anyone tell me if this is what I'm after - or is there something better I can use
(A new, colourful, "different" sort of desktop, that I can run Cubase and Logic from)

Thanks... Rob

Tried this and it seems to work now...at least the buzzer just beeps once right when powering up.

Connected to a Falcon:
The display reads .8.8.8.8. all the way across, but CAF apparently can't see the device. I've enabled SMP4.DRV in the MROS folder of CAF and launched it.
Anything concerning the SMP 24 is 'grayed out' and can't be selected.

What next?

Thanks,
Brian

> IDE and SCSI are supported (ACSI, I think

ACSI is not supported as Cecile is meant for the Falcon only, which does not have an ACSI port. (Somebody please correct me if I'm wrong and ACSI support has been added to Cecile.)

>>4. Optionally supports PC partition schemes
>
>Cecile can read DOS partitions.

Which partition types? Only up to 32 MB or also the other, newer types used by Windows?

Not sure. Start the unit without connecting it to the computer.
The buzzer should sound Beeep Bip Bip Bip (Long-short-short-short) and the
display should show a scrolling message.

If this is the Atari version of MagiC, we (DDP Translations) prepared a full
English package of 6.20 for Atari Workshop here in the UK last year.

Cheers

I know this one, for the SMP24 to work, it needs to have version 1.6
software (for the SMP, not cubase), it tells you this in the cubase 3
manual, if you have it.
Though mine came with a german manual, there was a piece of paper
attached saying that it had been updated.

What you'd do about it these days being updated, I don't know.

The ROM chip thinggy has a sticker marked 1.65.
I get the one long beep, but not 3 short ones.
This is with or without it being connected to a computer.

You pretty much answered your own question. MiNT is, or rather
FreeMiNT is a free open source version of Atari's old MultiTOS
kernal. Whatever Atari's did, the current release does, only
minus bugs and plus a huge amount of improvements.

Unless your music apps are very multi-tasking freindly you
may have problems making them run under FreeMiNT.

What TOS does your Atari have? I have a STe and can format disks
on it, insert it in my wife's PC. put files on it and then put it
back into my STe and get those files with no problems. If you have
a TOS that is less than 1.4, you will need a formatting program
for the Atari that will put a PC boot sector on the disk. I have
one somewhere. Email me if you need it.

When I switch mine on, I get a scrolling "SMP 24 1.6"

Do you get this, if so, I've attached the version of MROS that worked
for me, I've also attached the contents of the disk I also got with
it, in case any of it is any use. There is an english read me file
that may help you.
If your's is version 1.49 instead of 1.6, then it won't be MROS
compatible (but see the read me for details.)

366. Matrix video card help

Newsgroup: comp.sys.atari.st
Date: 2003-01-15 17:06:29 UTC
From: Mark Duckworth <mducksub@nospaamatari-source.com>
Message-ID: <1042656851.587176@blade.atari-source.com>
Source record: 29747

Hello everyone,

First I'd like to say thank you to everyone who helped out with my original question regarding my Matrix video card. I believe to have properly identified it as a Mico with a truecolor memory expansion. Now I want to very carefully attempt to power it up. This question, to boris as well, is are the wires attached to the small thing on the expansion board SUPPOSED to be soldered somewhere on the original vme board?

http://pikachu.atari-source.com/~mduckworth/matrix1.jpg

I just want to be very careful with this thing before attempting to power it up. There is also some sort of power connector as well as an expansion connector of some sort... looks to be about IDE sized.

Any other information would be helpful too. Can this card be powered up without the ram expansion? If it's a Mico does that mean it will work on the mega ste (mega ste would be much easier for testing and repair for me). etc.

Thanks in advance for any replies.

Mark

I think you're right, and it doesn't appear to do what I'd like.

HDDriver would look good, except I can't get the demo version to boot with
Aranym. It just sorta hangs there for a while.
And, anyways, I don't know how much 35 Euro's is, but it's probably way too
much to spend on a pet project like this. Not that it's an insult; a nickel
would probably be way too much to spend for what I have in mind :)

I'll see about getting MiNT to work without using EasyMint and an ext2
partition. I know it won't really be the same, but what the hey.

For me, it starts up, displays the beginnings of the main window (minus the
icons and message list), and then the entire system freezes, and all I can
do from there is hit the reset button or the power switch.

Sorry, I have never tried IConnect and it would not work here as I am not
using a dialup connection.

I don't know how IConnect works but I suppose there should be some way of
checking if you get lots of dropped packets.

I seriously doubt that NVDI together with fVDI should put any
considerable general strain on the processor. Actually it should be the
other way round as they both are optimized for speed.

Hooking into interrupt vectors is another story, though.

"Rob" wrote
> When I switch mine on, I get a scrolling "SMP 24 1.6"

I don't get any sensable message when I power the unit on.
Instead:
It beeps one long chirp and displays something like:
.8.8.8.8.8.8.8. (filling up all of the LED's).

None of the small LED's around the buttons light or flash (I.E. smpte lock)

Now I'm wondering if there is some way to tell the unit to reset
itself/initalize, or if it's something the SMP does each time it powers up
anyway. I.E. Most of my synths have some button combo you press when powering
up that will clear any memory, reset everything to factory status, and run
internal checks, etc...

I've checked for loose wires or chips and there are no visible problems, tho' on
the bottom side of the board, some of the lacqure is a bit flakey from heat/age
etc.
All of the PCB tracks, at least those visible to the eye seem solid enough.

The one chip that looks like it may be some sort of EPROM has a yellow sticker
on it and is labled by hand 1.65.

For some reason or another...the unit isn't initalizing and booting up
correctly.
Any ideas about what to check next would be very welcome. Or..if anyone knows a
good place to send such a thing for repairs that would be nice to know as well.
I'm thinking Steinberg Germany would likely be more helpful than they will here
in the US, but my German is nadda. If Steinberg won't help, there's the
possiblity that the company that made the things (Waldorf) might be able to
service it....again, I'd need a German friend to help me communicate with them?

> Do you get this, if so, I've attached the version of MROS that worked

> it, in case any of it is any use. There is an english read me file
> that may help you.
> If your's is version 1.49 instead of 1.6, then it won't be MROS
> compatible (but see the read me for details.)

Thanks much for the attachments Rob!
I'm sure I'll need these if/when I can get the thing to boot properly.

Thanks,
Brian

Hi Derryck,

You already know my interest in Texel2, I think. I use Texel1 regurarly
with no problems yet and have tried the German version of Texel2 without
any problems (except the language, of course). I am willing to test your
English version: indeed, anxious to do so :)

Charles.

Yes, a lot has happened since the original MultiTOS distribution that came with your Falcon. MiNT is now an open source project called FreeMiNT and heavily under development. Also there is now N_AES (commercial) and XaAES (free) as a MUCH better replacement for the MultiTOS AES (named GEM.SYS). A nicer desktop is provided by THiNG.

But if you want to use your Atari for Cubase and Logic and many other old MIDI apps, I would personally recommend to stick to Single TOS.

Martin Tarenskeen

To anyone,
Just putting out one last call. Does anyone know of

or has seen or heard of a program or app or control
panel utility that can show processor load??? I know
that the CT60 when it arrives will show processor load

via a control panel program supplied by Didier M. for
customization of the CT60 but it only works with the
CT60 and I believe the CT2b. I dont think it will
work on a stock falcon. I could be wrong. But any
other suggestions are more than welcomed. I know
other people have e-mailed me and say they know that a

program exists but cannot think of it off the top of
there heads. Thanks in advance.

Thanks,
Carey Christenson

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, I avoid going into debt and I avoid making promises I can't keep! This includes not offering services that I cant follow up with! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Atari's a New Good Home! So I'm involved in saving Orphaned Atari's from Atari Heaven! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!

> thanks all (any help will be greatfull)

As the Quantum prodrive defintitely works with the Atari I guess that
the drive does parity checking, but some old host adapters for the Atari
don't provide parity information. In this case there are three solutions:

1. Switch parity off by setting/removing a jumper on the drive. This
only works for some drives.
2. Connect the drive to a TT or Falcon and switch parity checking off by
software. HDDRUTIL can do this, but not all drives offer this option. As
soon as parity check is disabled the ST will see the drive.
3. Get a host adapter like the LINK96/97 with parity support.

Note that if parity checking is the cause for your problem you cannot
solve it by using another hard disk driver.

391. Falcon LAN connector

Newsgroup: comp.sys.atari.st
Date: 2003-01-16 18:42:54 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0301161940240.224-100000@easymint>

Forgive if this is a stupid question, but what can I do with the LAN connector on my Falcon030 ? It's the only part of my Falcon that I have never used yet, and it makes my curious.

The 1220S and Scan-X Pro work nicely together (I have them all ready ;-)
Mine has done quite a lot of work and I've had no problems yet (touch
wood).

I'd really like a hi-res Slide/negative scanner though (hint-hint).
They are nearly all USB or Firewire these days though.

Regards,

Peter

As it is RS-422, it /should/ be easy to use it for connecting 2
falcons, TTs or MSTes, or a mix, with only 4 wires : 3, 5, 6 and 8.
That is, T+, R-, T- and R+. To connect two falcons, A and B, you
should theorically only have to connect A(R+, R-, T+, T-) to
B(T+, T-, R+, R-). It would even be possible to connect up to 10
computers, using multidrop wiring, but so far I couldn't find
any description of it - why didn't they use rs-485 instead!

I got a 2nd-hand one, with penultimate version of scan-X pro.
I don't know which is faulty (the soft or the scanner), but here is
what I noticed :
- in fast mode, the scanner goes beyond the left of the area I
select. With small areas, the error is almost insignificant, but
with an A4 page, it is 1 cm!!!
On the other hand, the bottom of the area is truncated... the
biggest the area, the biggest the error :-(
- in slow mode, when attempting to scan something near the bottom
of the scan area, the head goes beyond the bottom of the document
and, if it weren't boxed, it would continue for about at least 5cm.
that is : when attempting to scan a 30 cm picture, the scanner
behaves as if it were 35 cm long!
I couldn't check if it is the hardware or the software, as I haven't
a pc with a software that goes yet. I think the reason is the version
of the software I got - I hope it isn't the scanner itself!
Did someone notice the same strange behaviour with earlier versions
of scanx pro ?

TIA,

J.-Luc

From: Jean-Luc CECCOLI <wdwd@wd.com>
Message-ID: <WS3.543bf19f.142c42e2.wdwd@wd.com>
Source record: 29778

Hello,

Did someone succeed in connecting a TT / Magic / Sting / Ethernec to
another machine ? If so, could I be explained how to do ?
I connected my TT to a laptop running XP, and used Sting to ping
the PC. But, after a few seconds, there happened to be dropped
packets, which went increasing more and more, until there was not
any received packet anymore, though the PC could detect data coming
from the TT. As if data became corrupted after some time...
I'm feeling more and more sceptical, and would apreciate any kind
of help :-/

TIA,

J.-Luc

The answer is ... not much. The LAN connector, if I recall, is wired
to your serial port. Some people have attached their modem to the LAN
connector using wires intended for a Mac. This then leaves the serial
port free for a nullmodem cable or a serial mouse or an older digital
camera. Of course, you can't use both at the same time, but it keeps
you from having to switch the connectors of two devices back and forth
all the time.

Now I have an SMP 24 to use with CuBase Falcon Audio.
Sadly, I have no manual, and this thing seems to have a million and seven programmable things about it. Does anyone have a list of parameters and what they do? An extra Manual to sell...or willing to loan yours out long enough for me to make a copy?

If I can get a listing of parameters at least....I'm thinking I could figure it out from there.

One thing I'm trying to figure out ASAP if someone with a manual can help.

I have a tape device striped with 30fps SMPTE time code. This track is being sent to the 1/4" SMP 24 SMPTE input. I did manage to figure out how to get the Falcon/SMP to stripe a tape...so time code compatability shouldn't be an issue...this code was written via the SMP 24.

I can't figure out how to set this thing up so it will lock to the timecode on the tape, and in turn lock the Falcon as well. In theory...I should be able to set a song start point, offset time in CuBase, disable master, enable sync....then pressing play on the tape should start the Falcon playing in sync. So far, I can't figure out how to make this happen! Any help would be very welcome.

Thanks,
Brian

>

For those of us on older machines (TT, Falcon), the PCI card approach needs an adapter. I'd rather see a USB board that plugs into the cartridge port for maximum compatibility (although unfortunately that will greatly limit the throughput of any devices). Other possibilities would be VME (fast enough, but limited to TT/MegaSTe), or the Falcon bus slot.

>From what I understand two pieces of software are needed; a low
>level USB driver and a driver for each device. I don't know much
>about low level software but would the USB driver be a vdi
>extension ?
>

Doubtful, I think of it more as a SCS)DRV-like interface, one that manages the USB itself rather than things attached to it. It might well make sense to use the SCSIDRV interface with unique bus number(s) for USB.

>I don't think it is a particularly complicated standard, maybe
>there is some open source software that could be ported ?
>

I think the most important issue is probably the hardware; after that, it would be developing drivers that understood USB-connected devices (although I rather suspect that it might look a bit like SCSI ...).

>Perhaps some sort of competition could be launched with the

Not a bad idea. I'd certainly like to see USB support.

It seems to work for some people, but not for others (including me). I
have a suspicion that it's some kind of timing problem on the
cartridge port, but haven't had time recently to investigate further.
Kenneth Medin found it worked only if there was a particular sequence
of drivers in his STinG folder.

Regards,
Roger

I have an EtherNEC on my TT but with MiNT-Net and Odd's driver.
Works great, I've let it sit on IRC for some hours and moved
some files back and forth from my other machines with no problems.
Perhaps I am very lucky.

Most links count as one. The LINK96/97 does because it provides
initiator identification and thus has an id (#7) of its own. The ICD
LINK with clock, as far as I know, uses one ID for its real time clock.

Hi Erik,

>The ongoing developement of MyMAIL contains parts for
>SMTP Authentication but no one of my testers or myself has a ISP
>that supports that.

You don't need an ISP which supports that protocol, take a free mail account
at http://www.gmx.de and you can test it yourself... GMX has its own POP and
SMTP servers, the SMTP server needs authentication.

Cheers from Belgium

Hey rES, got any more info on this, as I would if I knew what I was
looking for (how many in's and outs, and where to get one)

Rob

Thanks Adam, there is some useful info on your website. I had a look for
a CD-iso download but at 650Mb it will take days to download via my 56k modem.
I have got adsl but it's not working yet (of course if I had Linux I could use
it !) I think I will buy the CDs from somewhere.

Has anyone got actually tried Linux on their Hades/Milan/Falcon040 ?
Is Debian the only up-to-date Linux m68k distrubution or are there others ?
How useable is it ?
What desktop and apps do you use ?

Don't worry I have no plans to put Aranym on top of my Linux installation
on the Milan but I suppose it would be possible. It wouldn't have to emulate
the 680x0 code ;-)

Regards,

Peter

hi,

do you use the correct card? you should use one with a Realtek 8019 chipset because this chipset is faster than others and it's the only known (well, maybe there are others, though) chipset that works in this fast mode. "slower" chipsets work with ethernec but you will have >50% data loss. ethernea (acsi port) can handle both card types.

Hi Carey,

>Does anyone know of or has seen or heard of a program or app or control
>panel utility that can show processor load???

Yep, I do :-)
You need to locate a German app called Fritz written by Wolfgang Eger. I know
I have it somewhere here, but can't find it at the moment...

Fritz is a graphical multitasking system meter.
Some of the tasks it can perform:

-Keep track of the number of times the system has been booted
-Keep track of the time the computer was "on"
-Password protector
-Memory usage meter
-CPU load meter
-Speedo meter
-Sound VU meters
-Analog clock
-Calendar
-Hard disk info
-Mous arrow finder
-Auto window topper
-Caps Lock status
-Auto task terminator
etc...

It's a MagiC only program, but will run under N.AES 2.0 with a lot of its
features disabled. At the moment it's only available in German, but that's
about to change, once that I've located it ofcourse... ;-)

Cheers from Belgium
Dennis

416. HighWire 0.1.1 is released

Newsgroup: comp.sys.atari.st
Date: 2003-01-18 00:32:52 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.tipfsddt@localhost>
Source record: 29794
Body handling: HTML body converted to readable text

The HighWire Development Team release HighWire 0.1.1

Following HighWire 0.1.0 (downloaded 238 times so far) the new version offers a good deal of stability improvements as well as some typical bugfixes. Work have also been put into the experimental online support, making HighWire connect faster and also allowing it to work with a lot more servers than 0.1.0 did. You could say that the inofficial online support has been officially improved ;)

What's new in HighWire 0.1.1? (snipped from change.log)

- Overworked recognization of link areas, still not perfect yet but much better now.

- HTTP protocol layer reworked, is faster now and works for much more servers now.

- The problem of files with long names not loaded at some Magic versions (eg. *.html) is solved now.

- Added a workaround to have it working under Geneva again.

- Fixed several remaining bugs related to "LI" tags.

- Implemented and tags, also is working now.

- Table cells with percentage width are working now.

- Images that has not more than 1 pixel width and/or height don't get a place holder anyore. That makes pages looking nicer if some spacer gifs couldn't be loaded.

- Fixed some oddities related to transparent GIFs.

- Reworked code to avoid flickering mouse pionter when moved over window's title or info bar or being exactly over a frame's border.

- Bugs #0020, #0022, #0080, #0086, #0087 resolved.

421. HD Driver and Boot Partitions

Newsgroup: comp.sys.atari.st
Date: 2003-01-18 15:51:37 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3e297809.0@entanet>
Source record: 29699

I have recently fitted a 20Gb Hd into my Milan on IDE2
in addition to the original 2Gb that I boot from.

What I want to do is boot from the new HD so I partitioned
it with a 1Gb partition, then some 5Gbs and a 4Gb using
HD Driver 7.71

Each HD is a master on its own IDE cable that they share with a
CD ROM and a CD-RW. I thought that I could simply swap the 2 HDs
or just swap the IDE cables on the motherboard and that HD-Driver
would now boot from the first partition on the 20Gb drive.

The Milan boots and TOS detects both IDE drives then HD Driver
starts, detects the first drive and then locks-up.

I also tried leaving things as they are and pressing CTRL during
the device check. TOS then asks if I want to boot from IDE 2
(the 20Gb). I enter Y and then HD-Driver starts and locks-up.

I also tried booting from a floppy and then running HD-Driver
but get the same problem.

I think that the boot partition may be too big (954.6Mb according
to HDRUTIL) but I thought 1 Gig was ok with TOS 4.0x or does it
have to be smaller for boot partitions ?

TIA

Peter

422. Re: What Is MINT

Newsgroup: comp.sys.atari.st

From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <YUhW9.40305$Jm2.24807@news.bellsouth.net>
Source record: 29701

Hello Rob...

MiNT is a preemtive multitasking kernel.
The major differences between this and the TOS that is built into your Falcon are:

The MiNT kernel itself provides the ability to load several programs into memeory and give them each a 'timeslice' of processor time. These timeslices 'cycle'. In many cases (using a utility called nice) you can even set priorities for which program(s) should get more CPU time. With some know-how, you can also get really fancy with MiNT and make it a multi user system that designates a maximum amout of RAM and processor time that particular users can use, and that applications can grab for themselves.

MiNT also allows various drivers and plugins to be booted with the kernel. For instance...one can install MiNT-Net sockets, device drivers, or the intellegent bits to deal with various hard disk partitions (such as EXT2). Common drivers are PPP, Plip, ext2, minix, serial devices, alternate consoles, mouse drivers, ethernet boards, virtual consoles, and more.

MiNT is as POSIX compatable as possible. This is mostly of interest to those who program, or wish to compile standard ANSI C sources (usually written with unix based machines in mind). This means that given the right compiler and libraries, one can compile a plethora of code targeted to unix (the hardware itself doesn't matter). One example is the ability to download sources for something like IRC (Internet Relay Chat), Pine (Email and News Group clinet), or TinyFugue (A glorified telnet client designed for text based multi user games/chats) from the net and compile it right away with few to no changes to the code.

MiNT is just the base of things and in and of itself only supports basic disk operation and vt52 screen manipulation.

Other aspects of a complete MiNT setup include the AES, and the GEM routines. This is the part of your Atari OS that invloves drawing and manipulating windows, icons, dialogues, and dealing with the data inside them.

One Example is the GEM/AES that is built into the Falcon. You see it almost immediately when you boot up your Falcon upon the desk-top. The built in GEM/AES/Desktop of the Falcon can indeed run with MiNT, but, it lacks the ability to launch more than one application, and also has limits as to how many windows can be open at once, etc.

Notice, when you installed MultiTOS...
You put a file called mint.prg into the auto folder.
You put a file called MINT.CNF into a folder called MULTITOS or MINT.
You put a file called GEM.SYS into a folder called MULTITOS or MINT.

You put a file called GEM.CNF into a folder called MULTITOS or MINT.

mint.prg is the kernel.
MINT.CNF is a text file that sets userdefined parts of MINT.
GEM.SYS is the GEM/AES/Desktop part of things.
GEM.CNF is a text file that sets userdefined parts of GEM, such as paths and file extension information.

Now, when you boot your Falcon, mint.prg is one of the first things to load...and once all of your auto folder programs get loaded it usually looks for GEM.SYS (you can address what mint will load, and how it loads at boot-time inside the mint.cnf file). If mint.cnf does not contain the line exec file.prg or gem file.prg, or these programs don't exist as stated, it will load the built in GEM/AES/Desktop.

One common misconception about MiNT is that it requires a unix partition and all sorts of complicated set-up files. This is not entirely true. Really, it depends upon what you wish to do, the set of tools you intend to use, and how important security is. The reason most people go ahead and install a complete set of unix tools is because so many clients and things already exist that were written with unix in mind. I.E. The ncurses screen driver makes it a breeze for a program to compile and not worry about if it should use VT52, VT102, etc., or lynx can compile and use standard calls to MiNT-Net for it's http access. Also, many of the already existing programs intended for unix will want to check up on security issues with files...like ownership and permission. It's easier to just install it all than it is to try to strip out uneeded stuff.

Since Atari released the commercial version of MultiTOS (shipped with Falcons, and also sold seperately for ST use), Atari itself did one major improvement to the GEM/AES/Desktop part that eventaully made it out to the FreeMiNT community. This is known as AES 4.1.

AES 4.1 does offer some advantages over the initial MultiTOS release, thoe I can't name any from the top of my head. Most of the improvements, if I recall correctly involve the AES part of things. This is dealing with how GEM applications get multitasked and windows and such are kept up with so the system doesn't get confused about what GEM objects belong to what application(s).

Since MultiTOS and AES4.1...
Several improvements and enhancements have been made by others.
Geneva for instance, works with some mint kernels. It replaces the AES and gives the Atari a new, faster, look and feel. N.AES (commercial) was next on the scene with a more complete AES designed to properly take advantage of more mint offerings. The latest AES replacement to date is called XAAES and is free/opensource.

All of these AES changes give GEM the ability to more properly and efficently multitask GEM applications. They all give the system a slightly different look and feel. One example of things you begin to see with these newer AESes would be more gadgets in the windows, like iconify, hide, or even the maclike ability to double click the top of a window and see it shrink into something like a tool bar. The ability to drag a window halfway off the left edge of a screen. Real

time window scrolling in the back ground. The ability to define what fonts get used where and their sizes. Common pipes, and clipboard standards. New file selectors that offer more options, and support for long (fat32,ext2) filenames. The list goes on...but this should give you a basic idea of what a multitasking GEM and AES is all about.

The desktop.
MultiTOS and AES 4.1 both come with desktops that look and act very similar to that built into the Falcon. The major difference being the ability to launch more than one GEM application at one time. Neither of these desktops recognize long filenames.

Geneva, N.AES, and XXAES all treat the desktop a bit differently. By default, they don't have one at all. You define an alternate desktop that hopefully is multitasking friendly. Or, you can run them without a desktop. Tara Desk is free/opensource. It's a small and fast bare bones DeskTop, but is reported to exist quite happily under MiNT as a multitasking aware desktop. Thing is shareware, and is also packaged with N.AES (tho' the version that comes with N.AES only works with N.AES). Jeenie is yet another very powerful desk-top, commercial, that is reported to get along very well with MiNT. NeoDesk and Ease aren't bad either, but neither of these will notice long filenames, and have lagged behind in some protocol advances such as the AVSERVER (a desktop protocol that assists in having one program, or the desktop launch another and send along instructions or pass files).

The file selector is another thing to consider.
The one that comes with MultiTOS, AES 4.1, and Geneva is very basic, and is unable to deal with long filenames. XXAES and N.AES both have newer, more advanced file selectors. In any case, you can replace the file selector with one of your choice, such as Freedom or BoxKite.

GDOS and the VDI
This is a part of the Atari OS that deals with Screen draws, fonts, and driving printers. GDOS can be used for other things as well, but these are the most common uses.

NVDI is commecial, quite good and quite common. It speeds up screen draws considerably, and can also support some graphics cards. NVDI also has a GDOS that can use vector fonts on screen and with your printer (Speedo, TrueType and Post Script).

fVDI (free/opensource) was initally intended to replace the built in Atari VDI as a part of Dolmen. Dolmen was to be a new OS streamlined and optimized for beefed up Falcons (CT2, CT060), Future Falcon Clones, and other TOS machines like Hades and Medusa. Like NVDI, fVDI is supposedly much more effecient at working with screen draws. fVDI is REQUIRED to run some graphics cards, such as the ATI RAGE PCI cards that can be installed with a Falcon BUS to PCI bridge. fVDI is also more or less the new standard for opensource VDI work due to the ARAnyM project which seeks to put TOS/GEM compatability on any hardware platform. fVDI does not include GDOS. If you intend to use a GDOS with fVDI, you can use the standard Atari one that does NOT support variable sized vector fonts, or you can use the commercial Speedo GDOS (Speedo, TrueType, PostScript),

or the GDOS portion of NVDI.

A good VDI replacement is very much worthwhile in any Falcon set-up. ESPECIALLY with MiNT. The machine feels MUCH faster!

Music Applications and MiNT...
Logic supposedly will work under MiNT, MagiC, or Geneva. I don't own it, can't find it anywhere for sale, so can't try it personally :/

CuBase doesn't like MiNT, and it doesn't like MagiC...I've never gotten it to run under any MiNT/AES or MagiC variant myself. Steinberg's own MROS task switcher doesn't work on my Falcon either. So far, the only reliable task switcher I've found for the Falcon and Steinberg music software is Geneva (without MiNT...thus a cooperative multitasking switcher...works by system inturrupts as opposed to preemtive time slice sharing like MiNT/MagiC or the Geneva-MiNT combo).

I haven't succeeded in getting Avalon to run on my Falcon, but some users with a Dongle Switcher (Combiner, Mindex+, CartMaster) have reported that if they launch CAF FIRST, press play then stop, and have an STe sound emulator installed, they can at least get it working, under single TOS or Geneva.

Sample C works fine for me on all of my Ataris, under any OS.

Zero-X supposedly will work under MiNT, tho' I don't have it yet to try.

Notator/Creator does not work at all on a Falcon.

KCS Level II, Omega, Copiest, Band In A Box etc...
I've not tried these under MiNT, but because they frequently draw to SCREEN rather than working with windows...I'd assume they'd be quite messy...if they work at all. I have used these under Geneva however. Geneva allows you to 'hold the screen' for the topped application. In some cases under geneva, it's best to run the program in a 'single tasking mode' that puts any other running application to sleep, and avoids issues of screen droppings or other conflicts that may arise.

There are boocoups of other MIDI apps out there...many free these days. I haven't tested any but those listed above with MiNT. Give them a try and let us know what happens ;)

Brian

As you can see by the message below, this user was going to send a TT keyboard to me, he even said he mailed it himself. This was in June of last year, it's never showed up and e-mail to him goes un answered.

Is there anyone who knows this guy?

From: "Dennis Vermeire" <dennis.vermeire@gmx.net>
To: <starlord@inreach.com>
Subject: TT keyboard....
Date: Tuesday, June 11, 2002 10:11 AM

Hi Dennis,

Just a few lines in hurry to let you know that the keyboard is on its way, I brought it personally to the post office myself this morning....

Let me know when it arrives...

Regards, take care
Dennis

Dennis,
Thanks for heads up on a program that can do what I need. Let me know if you find this program. Does anyone out there know of this program that Dennis talks of??? He said the name is FRITZ and it is a German app and was written by a guy named Wolfgang Eger. Any help in this matter would be greatly appreciated.

Thanks in advance,
Carey Christenson

To answer my own question...
I discovered the problem was a bad/noisey audio cable!
Swapped that and it now syncs to the tape no brainer.

Thanks, I'll check that. Odd that this would happen, as last time I used it
successfully (was with STiNG), I didn't save settings or do anything that I
know of that would have altered the file (unless it saved something wierd in
the file by itself). Of course, stranger things have happened! Thanks for
your help!

...t under the collar.

Not really. As usual Atari Workshop never seem to blow their own trumpets so one never knows what's happening there.

We also prepared an English version of CAB2.8 for them a long while back, so anyone wanting an upgrade or buy from new should contact them for news of that, or the MagiC 6.20 already discussed.

I have one too. Got it for a nice price 2nd hand. The only trouble was
that it didn't work with XaAES for a long time. But this was solved
with the latest XaAES versions, thanks to Henk Robbers.

Another problem still is that my Falcon SCSI port has problems with my
CT2b. ScanXPRO can only "find" my UMAX scanner when I have switched the
CT2b turbo mode off. :-(

I have this problem but the error is much smaller. I generally scan small areas or the whole page area so maybe I haven't noticed it too much.

Galen mentioned colour photocopying. Like you I work around this by scanning and then printing the image. So it's not a major problem for those occasions that I need it.

I do have an odd problem when I scan directly into Photoline. When the image has loaded and I click on the window enlarge widget (top-right) the window expands to fill the screen but the image is damaged.

Instead of looking like this:

1234
5678
9ABC
DEFG

I get:

1234
5678
1212
3434

and the colours in the lower half of the window are all wrong.
I think this is a problem with Photoline. I have lots of memory
so I can work-around by copying the image to the undo buffer,
clicking the enlarge widget and then undoing the damage. After
that it is ok.

Nima, are there likely to be any updates to Scan-X ?

Regards,

Peter

Message-ID: <3e2afe43.0@entanet>
Source record: 29720
Body handling: HTML body converted to readable text

Another excellent release.

This verstion is much more usable online, all those sites that
were not accessable previously now work. Even without graphics it
is very nice to use. I even used it to check the Highwire Forum !

The transparent GIF problem has been fixed. With working graphics
(JPGs and animated GIFs aren't working yet) it would look like a
full browser. Guess what I would like to see next ;-)

Has much work been done on Forms ? I only ask in case you want it
testing. Are cookies handled yet ?

Is there going to be an icon bar (Stop, Refresh, Back, Forward etc.)
with some status info in it (current file downloading, percentage of
file downloaded, number of files to download) ?

As Highwire gains more browser capabilities it might be worth adding
these "nice to have" application features so that it can be used like a
finished product even though it isn't yet finished. Some people might
be put-off by the lack of a hotlist or other superficial features.

Regards,

Peter

439. Re: What Is MINT

Newsgroup: comp.sys.atari.st
Date: 2003-01-19 19:36:42 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3e2afe4a.0@entanet>
Source record: 29721

When I first got my Milan I was a bit dubious of Mint and NAES.
I had installed Magic on my ST and that was a bit of a culture
shock; strange desktop, multi-tasking and so on. I have to say
that Mint/NAES and Thing have been very reliable. I have upgraded
Mint several times and had no problems. The same cannot be said
of the PCs in my work place.

A few days ago I did the EasyMint install. This was perhaps more
worrying than installing it on a machine without Mint because I
didn't want it to wreck my working environemt. Luckily it didn't.
I undid a few changes to get HS-Modem and ExtenDOS working again
and I was back in business. I had a rudimentary MintNet set-up
and I managed to move it from a TOS partition to the new Linux
partition where the Mint folders are.

While doing all this I started to ask myself a few questions.
FreeMint is a Unix environment that allows a GEM environment to
exist on-top/alongside but what are the aims of FreeMint development ?

Is it to just to allow GEM and Unix programs to be run on the same
platform ?

Or is the aim to move GEM to a Unix like environment ?

Has Linux had any affect on FreeMint development ? Will they converge
or is that not the intention ?

I don't want to start a flame war. I am just curious about where FreeMint
is going.

Regards,

Peter

Typical isn't it. Just after I sent this I realised what I had
done wrong. I will go to the bottom of the class for this one.

I stupidly made the first partition on the new disk a BGM type
instead of GEM. I think I got it into my head because it is
fairly big at 1 Gbyte.

Sorry guys.

Next question. Why does the boot partition have to be of type GEM ?

Regards,

Peter

Hi,
The margin of error you are getting seems to be awefully large.
When I tested ScanX, it was fairly accurate for Umax scanners, since the
scanning window is calculated based on pixels (as opposed to 1/6th of an
inch +/- for Microtek scanners)

I will retest this again tonight and will let you know of my findings.

As for new features, feel free to send me your feature requests. It's been a
while since I last worked on ScanX, but, depending on the feature, I might
do something about it :)

cheers,
Nima

>GDOS and the VDI
...
>fVDI (free/opensource) was initally intended to replace the built in Atari VDI
>as a part of Dolmen. Dolmen was to be a new OS streamlined and optimized for

I think you may be confused because of the similarity between Phenix,
which was to be an '060 board for an Atari compatible computer (see
http://www.czuba-tech.com/phenix/english/overview.htm) running Dolmen,
and Fenix, which was/is a replacement for GEM/TOS/MiNT (see
http://www.it.lth.se/~sven/Fenix%5Cindex.html).

The 'f' in fVDI stands for Fenix/Free/Fast, not Phenix (which is kind
of obvious ;-).

fVDI (see http://www.klockars.net/fvdi.html) has never had anything to
do with Dolmen.
It has always been intended to be a free (GPL) replacement VDI (and I
do not consider GDOS to be a separate part in any way (IIRC, the
original VDI (for the PC) did not have any such separation either)).

>fVDI is also more or less the new standard for opensource VDI work due to the

It's not like there was ever an old standard for that. ;-)

Anyway, while there has recently been a few requests for the sources
(there is a cvs archive with public read access), so far I've been the
only one to work on the fVDI engine itself. The Galaxy (Mario Becrot's
VME graphics card) driver and large parts of the ARAnyM driver have been
written by other people, though.
I hope more people will join the development in the future.

>platform. fVDI does not include GDOS. If you intend to use a GDOS with fVDI,

That depends on what you mean by GDOS.
If you mean for example
- loadable device drivers
- loadable fonts
- bezier curves and areas
fVDI does include GDOS, since all those features are already built in.

If, on the other hand, you mean for example
- support for already available printer drivers
- arbitrary scaling of fonts

- vector fonts
fVDI does not currently include GDOS.

It would certainly be possible to write a printer driver for fVDI,
just as there are several different screen drivers. It just hasn't
been done. The code for arbitrary font scaling should be in there
already but it's not activated/tested.
Vector font support has always been planned (using FreeType), but I
have not yet gotten around to actually doing anything about it.

>you can use the standard Atari one that does NOT support variable sized vector
>fonts, or you can use the commercial Speedo GDOS (Speedo, TrueType, PostScript),
>or the GDOS portion of NVDI.

Not all GDOSes work on top of fVDI. For example, the recently GPLed
TTFGDOS does its TrueType fonts in a way that can not work with fVDI.
Early SpeedoGDOS used lineA for screen output, which also does not work.

Most (all?) versions of NVDI should work fine on top of fVDI, however,
as long as their normal screen drivers are disabled (just as you would
do to use NVDI with, for example, a NOVA card). The latest versions of
Speedo are also supposed to work.
Regarding Atari's various GDOS variants, FontGDOS is supposed to work,
so I imagine it is likely that FSMGDOS would to. Probably even the
original one, but I've not heard of anyone testing it.

Well, I don't know about the Steinburg unit, but awhile ago I heard about how a MiniMacMan, by MIDIMan, would work with CAF on the lan port of a falcon. The person who told me about it was having trouble getting it to work on his Nemisis Falcon. (Kept freezing CAF.) I had a minimacman laying around and finaly got around to trying it out on my CT2B Falcon. I'm pleased to say that it worked (Sort of!) I am able to record to CAF from the in port of the minimacman, but am not able to play out from it.
When I plug it in, the midi in light of the minimacman lights up indicating activity, but not the out. The out light flashes once if I hit the stop button of CAF, but otherwise nothing. Never the less, it is nice to be able to record from the extra midi in.
Anybody got any idea if there is a setting I should check to activate the midi out? I've tried a different cable in case it was a cable problem, but no change!

>
> Or is the aim to move GEM to a Unix like environment ?

This is not an easy question to answer. I think FreeMiNT tries to provide a modern OS replacement for our machines, while still being compatibile with GEMDOS where it can (that means: in most places).

> Has Linux had any affect on FreeMint development ? Will they converge
> or is that not the intention ?

I do not think that FreeMiNT and Linux will ever to converge. The aim is to create enviroment, and while FreeMiNT remains useable on standard machines, Linux is not. FreeMiNT will remain separate. We do not need all the linux has, and Linux world does not need what we can offer.

> I don't want to start a flame war. I am just curious about where FreeMint
> is going.

Steady, forward. Work is being done all the time. UInfortunetly FreeMiNT must remian GEMDOS compatibile and that makes things complex. Why? Becouse FreeMiNT is only GEMDOS and has to live along with AES. This is the biggest problem. This is not easy to explain, but from FreeMiNTs point of view AES is almost nothing mora than a program. Yes, FreeMiNT has some tweaks to allow AES work at all, but this is a bad thing. AES protocols and how it comunicates with applications was not meant for modern virtual enviroments. It is a fast sollution but not the best one.

So, FreeMiNt developers have to join two things - past and future, and it is not an easy task.

Yes and no.
Think TT, which I'll muse more upon in a moment.

> Or is the aim to move GEM to a Unix like environment ?

Yes and no.
Think TT, which I'll muse more upon in a moment.

> Has Linux had any affect on FreeMint development ? Will they converge
> or is that not the intention ?

Maybe a little. My understanding is that Linux is really just another distribution of Unix. It supposedly trys to live up to the same standards as all the other unix variants, which were mostly laid out by university computing research programs.

As for MiNT, and my comments, "Think TT", here's the way I understand it. Some bright software engineers at Atari saw a possible future in doing a Unix workstation. They also felt that GEM made as much sense for a graphical user interface, if not more sense than the kludge along Xwin that was being developed at the time. GEM was fast, small, and very dern powerful for the time. If they could get this product out in time...Atari just might corner the GUI (Graphical User Interface) portion of the Unix market. A VERY good idea at the time...because if you've ever seen Xwin running on that generation of hardware, GEM is by far much zipper and responsive.

My guess is those engineers saw a the potential for a very valuable market. Unix work stations. So they began work on the TT, which initally was intended to be the dream unix workstation. Keeping compatability with ST software would simply be icing on the cake. Atari announced this machine and rushed to get it on the market. First as a beefed up ST, because this part of the system was all ready to go and on the prototype benches. Atari Unix wasn't quite ready yet, and to top it off, the FCC was holding them back on production due to some signal emissions from the machine. With every setback, the competition...Sun, Sparcs, etc...was capturing market share where hardware was concerned. By the time they had go ahead to do the TT, they really needed to be moving ASAP, so they stuck TOS 3 in the thing, and began shipping it as an 'improved TOS/GEM' machine...not saying much to the public about Unix...tho' if you read the old

press relases, there were subtle whispers about unix around the TT from day one.

When Atari finally had a Unix ready to go...they found the TT was way to much machine too late to compete in cost with the stuff that had already captured market share. Companies were buying two or three workstations that were right next door to dumb terminals...a box with a graphics card and a networking solution, for the same money that would get them a single TT. All the extra TOS/GEM bits, the extra ports, the built in SCSI, etc...just drove the price way to high to win very many big bids. Had the TT come out a few months earlier...they could have cornered a big share of the market, and GEM just might be the defacto standard for a Unix GUI.

So really, I see MiNT as Atari's attempt to do with the GUI portion of Unix what MicroSoft luckily was able to do with their stolen QDOS and the PC (Remember, GEM was owned by Xerox and Digital)...hit the market fast and hard with something not really theirs, but great (GEM) and hope it caught on. Atari just didn't get in on it quite fast enough. Not from lack of a very good effort mind you :)

That's how I figure it happened, and the direction MiNT intended.
Brian

You are exactly correct. I got Fenix and Phenix wires crossed in my brain. I also knew that CT2 boards simply don't work in their fast modes without a new VDI (NVDI or fVDI), so I incorrectly drew my own conclusions. I got fVDI mixed up with other bits of code *like Dolmen and Cecile* targeted towards new hardware standards and such. Also for some reason my brain had wanted to associate the f with falcon (falconVDI).

Thanks for setting us straight on that, and thanks for fVDI!

This is quite interesting news indeed.
It leads me to wonder what is different about that old MultiTOS kernel that allows CuBase to run. Is it CuBase Audio?

For later MiNT kernels, you rename MINT.PRG to MINTNP.PRG in order to disable memory protection.

Yes, it is quite alrite to run your Falcon without memory protection.
On my Falcon CT2b/EasyMint setup, with the 1.15something kernel and N.AES, I find very little that will run at all with memory protection enabled.

Have you noticed any other SCSI problems with your CT2b?
I had tons of them at first...
Turned out be a timing issue that was simply a matter of cutting a tracer on the CT2b and dabbing in a solder bridge between a couple of pads on the PCB.

Depending upon TOS version, with HDDriver it doesn't have to be GEM.
Not sure about Milans...
But on my Falcon there is not a single GEM partition, and nothing under 100meg (that's on the DOS/ATARI initalized ZIP drive, all else is 1gig BGM or 10gig LNX). My Falcon boots from an IDE 1gig BGM partition.

If this drive has parity checking enabled (see a previous posting) you
cannot do anything with a link not providing parity information. before
switching the parity checking off. If the drive requires initiator
identification you need a LINK96/97. Anything else simply will not work
in these cases.

HDDRIVER should never lock up, even with partitions too big for TOS.
Your version of HDDRIVER is quite old. I recommend to check whether the
current version behaves differently. You can use the demo version for
that (http://www.seimet.de/hddriver_english.html)

It doesn't have to be of type GEM. BGM as boot partition type is
perfectly legal. Otherwise it would be impossible to have boot
partitions larger than 32 MB.

This is becouse CT2b has fastram, and Blitter cannot work in fastram but
original Falcon TOS VDI tries to use blitter all the rime (you can't swith
it off).

Other VDIs do not use blitter. In most cases blitter is slower than CPU (!)
and can't work in fastram.

Brian,

many thanks for the so detailed explanations that you gave about MiNT
that must have helped more than one ATARI user back to his first love,
of whom I am.

well, I have the project, or let us better say for now the idea to make
Mint run on Power PC G3 processors (not on a MAC but a single G3). For
that, I wanted to rewrite the BIOS/XBIOS basic functions of the TOS, on
the top of which i though that Mint was based.

but you mentionned POSIX as the basic layer for running MiNT. Would you
have some more information about POSIX, how to adress it. Is it
documented (could not find much stuff on the Net)

I basically need to understand how much and how a developpment of a
layer for Mint on another platform is to be done. (i would expect to
directly interface the hardware but their might be some better tricky
approaches that re-use some linux existing low-level parts)

thx in advance, I hope that my french-english is not too tuff to decode!
Fred

From bios only few fuctions left that are not implemented in FreeMiNT. XBIOS is more hardware depedent and porting it to a diffrent hardware platform is a huge job.

> but you mentionned POSIX as the basic layer for running MiNT. Would you
> have some more information about POSIX, how to adress it. Is it
> documented (could not find much stuff on the Net)

POSIX is a standard for Portable Operating System, ie if you have two diffrent operating systems that are POSIX compilant it is usually very easy to port software from one to other. POSIX compilance is manadged not only by kernel, but also by standard library (MiNTLib in our case). If you wish to port FreeMiNT to another platform the you do not need to worry, becouse POSIX mostly defines interfaces to user aplications, not things so deeply hidden inside likewhat hardware OS runs on.

Long time ago, there was a MacMiNT, an effort to port MiNT to m68k-macs. If you want to know more, I advies you to check MiNTList archives.

> I basically need to understand how much and how a developpment of a
> layer for Mint on another platform is to be done. (i would expect to
> directly interface the hardware but their might be some better tricky
> approaches that re-use some linux existing low-level parts)

Most of FreeMiNT are written in C. Some critical parts are vritten in asm.

In fact, iI do not think that porting FreeMiNT to another CPU arhitecture is a wise decision. All software needs to be recompiled on it anyway, so much better thing would be to reimplement AES, VDI and what other is needed as a userlevel library that runs under the control of native OS. If you wish to implement 68k emulation, than ARAnyM is everything you need.

462. PC floppy in Falcon

Newsgroup: comp.sys.atari.st
Date: 2003-01-20 15:05:25 UTC
From: Adam Klobukowski <atari@gabo.pl>
Message-ID: <slrnb2o3n5.8s4.atari@core.preferuje.luzik.pl>
Source record: 29743

As my original floppy drive in my falcon was no longer working reliable, I bought a new PC floppy. I changed the DS (as it was many times advised on this group) and it works ok. I have one question: this floppy seems to be faster than the old one. Can I safely change fseekrate to 3ms?

Get the latest CT2b archive from the Centek web site if you don't already have
it.
Read closely the hardware installation files.
Their is a text file that describes a proceedure to test the SCSI timing.
Then it tells you what to try if your Falcon fails the test.

465. FS: Atari Mega ST2 with Notator Software/Unitor

Newsgroup: comp.sys.atari.st
Date: 2003-01-20 23:41:13 UTC
From: jamesbrey@aol.com
Message-ID: <20030120184113.06053.00000092@mb-fv.aol.com>
Source record: 29596

FOR SALE: Atari Mega ST2 with Notator Software/Unitor Synchronization

Here is perfect condition Atari Mega ST2 system with SM124 Monochrome monitor. It was used for a Emagic/C-lab Notator user and includes the computer, monitor, Notator software, Unitor SMPTE synchronization, manuals, power cords, etc.

This is a completely working turnkey system and a great system for a new user to MIDI sequencing. Notator is still an incredible software MIDI sequencer, even by today's standards.
It does 96 tracks and the Unitor provides extra discrete in and out ports.

Willl consider parting out system if someone wants just the Notator/Unitor-N combo. Wil give preference to Seattle area sale.

Please contact with any questions. Accepting all offers in cash or trade -- I want to move this thing! Thanks.

Interesting...
I found a Mac cable and plugged it from my Anatek SMP 7 7X8 SMPTE Midi PatchBay.
This actually works with the lan driver in CuBase Audio.

Note, you do have to boot the computer and CAF first, then plug the cable in.

Wow....I'm stumped that this works...
Will get back on how reliable this is, and advantages it might offer.

Found it, in the software.txt file! Next time I have the lid off I'll do that
mod, it's easily reversed if it makes no difference. Thanks for the hint!

Cheers

Derryck

I gave it a whack, but it seems to have the same symptoms HDDriver has, in that it does a scan of the SCSI bus forever.

Looks like I'm stuck with FAT directories.

This may be old news, but I was looking at a Vanessa Mae album
"Vanessa Mae The Violin Player" and I noticed that it was "scored and
sequenced using Atari 1040 with C-Lab Notator" I thought that was
cool. The album was recorded in 93-94.
Anyway she is not exactly my cup of tea musically, I'm more of a
classical type.

YES! sadly they were clipped off without labeling! And thus I have NO IDEA
which wire went where. Also, IIRC, the stack of sockets separating the two
boards was originally brass posts that got clipped and replaced with the
socket stack, which MAY BE VERY unreliable for connection

On my (same) setup, there is very little that will NOT run with memory protect enabled. It did take me some time however to select properly written software, and/or to change the memory protect flags (private, readable, super, global) of programs until (almost) everything worked. But for those programs that only run without memory protect, I still boot with MINTNP.PRG most of the time.

Source record: 29613

Hi,

I'm taking my ST out of mothballs after almost 7 years of using a Mac (I'll use the ST for midi editing). I've forgotten a lot so I'm grateful for any help.

I have an old Megafile 30 that is probably going to die soon. A friend gave me a 170 meg SCSI drive and ICD Link (original). I want to transfer the data from the Megafile to the SCSI drive. I've daisy chained the drives (ST-->Megafile-->Link-->SCSI drive).

From what I understand, the ICD driver software included with the Link works only with ICD host adapters, so it won't mount the Megafile. Other than buying the ICD "pro" level driver SW (if it's even still available!), is there a shareware or freeware solution? If not then I'll happily buy, but might as well ask first :-)

Also, I understand there are some DIP switches on the Megafile (haven't cracked it open yet). I assume I'll have to turn termination OFF there. Is that switch marked so I'll know what the hell I'm doing?:-) TIA,

Rob Aries

Hello Dennis,

Thanks for the info.

I already have a new account for testing this and
maybe i also will test on GMX.

Today I succeeded in the first Authentication on SMTP with MyMAIL
with help from Shiuming Lai.

The new feature will be included in next release of MyMAIL.

Get the TOS from the internet, split it into two even/odd seperate 128Kb
files, and have it flashed on two 29f010 flash eproms. That's the way I
did last month.

Bonjour,

Alors voil�, d'un cot�, un atari 1040 STF (en �tat de marche, ecran, souris, clavier, mais pas de softs) de l'autre, un PC (PIII 933, 256 Mo en ram, 50 Go en DD, carte son Yamaha 128, sans softs musicaux pour l'instant, autre que ceux fournis avec la carte son), au milieu, mon matos Ziq, � savoir, un Yam DX7+un expandeur Korg EX800+un vieux Kawai F100 non midi (donc, on l'oublie celui-l�, dommage), ma question :
Qu'est ce que je peux faire de tout ca (j'aurais envie de pouvoir jouer et preparer mes morceaux seul, de mani�re � avoir dej� une bonne trame pour ensuite trouver des zicos et remonter un groupe) ?
Qu'utiliser de pref�rence (Atari/PC ?) et quels softs me procurer en fonction des plateformes (j'assure en live, par contre, la MAO, j'ai jamais vraiment mis les mains dedans) ?

Merci d'avance

Christophe

Hi Dennis,

>As you can see by the message below, this user was going to send a TT
>keyboard to me, he even said he mailed it himself. This was in June of last
>year, it's never showed up and e-mail to him goes un answered.

First of all, I *did* send it.
I also asked you to let me know when it arrived, since you never told me that
I didn't arrive, I assumed you received it and were happily using it...
If I'm expecting a package from across the ocean, I'm not going to wait seven
months for it to arrive, if after 4-6 weeks it still hasn't shown up, it's
time to ring the alarm bells...

Secondly, since you keep changing your email address it's not really all that
easy to get in touch with you. Two mails to you bounced back....

Last but not least. It's very unfortunate that the package got lost. Over the
years I've send lots of jiffie bags and parcels to the US. Yours is the very
first one which doesn't got through. But if you feel the need to make this
public, then I would have appreciated it if you added to the post that the
keyboard was offered to you free, as it stands, you make it sound like I've
swindled you...

Cheers from Belgium
Dennis

Well, he's a french musician who hesitates beetween a 1040 ST with
no soft, and a PIII 933, 256 MB ram, 50 GB HD and Yamaha 128
soundcard, no musical soft either.
He would like to know which would be the best choice for using with
his DX-7 synthesiser and EX-800 expander, in midi environment.
He wishes to create an perform pieces of music himself, before he
could create a band.
He adds also that, whether he is pretty good in live performance, he
never really used a music software.

Will this help some of you to help him ?

J.-Luc

Sorry about the way it might have sounded, but I had e-mailed you when I changed from earthlink to this one, I pay less per month on this one which counts on a limited income. But I've not moved from the address and watched, I had figured that with all the goings on in the world (9-11 & such) it might take longer to get here. That's why I've watched the mail everyday.

I had sent you e-mail the week before posting here just trying to make contact and it came back to me with the dreaded error "User Unknown". So just to see if anyone here knew how to make contact with you I posted here.

I figure that maybe the ship sank, that would be my luck.

I spent some time pondering this one, for you are quite correct that
the included Link software won't likely boot the Megafile. I suspect
that AHDI (the Atari utilities) might work, and they are freely
available. Give it a try.

I don't know if HD Driver will work, but it is widely considered to be
the best software available. It is commercial, and the author himself
frequents this group.

On the other hand, if you don't intend to use the Megafile much
longer, you might want to just copy to floppy. A one-time only
transfer of 40 disks wouldn't take more than a couple of hours.

> Also, I understand there are some DIP switches on the Megafile (haven't
> cracked it open yet). I assume I'll have to turn termination OFF there. Is
> that switch marked so I'll know what the hell I'm doing?

Termination is part voodoo. Since the ST doesn't have internal
termination (as opposed to the TT, for example), a two device SCSI
chain should have BOTH drives terminated. That said, my STe refused
to play by the rules, and its four device chain had only one
terminator -- a through terminator placed BEFORE the fourth device.
Go figure.

One last note. Old SCSI cables can drive you crazy. If you can't get
it to work no matter what, it's probably the cabling.

60 pounds is steep, but that's the going rate. If you want it for
screen acceleration and not for printing, there's always fVDI, which
is free.

There's no flame war to it. I simply don't tolerate such stuff anymore, it's far better to edit the killfile and remove the crap talk from my screen. This way I don't even have to think about skipping it, suck lamers cease to exist on my end.

Atari Workshop (www.atari-workshop.co.uk) and 16/32 Systems
http://www.1632-sales.zenwebhosting.com/acatalog/) in the UK sell
unpopulated expansion boards but you have to track down your own
SIMMs, IIRC B & C (www.myatari.com) in the USA sell both populated and
unpopulated expansion boards.

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, I avoid going into debt and I avoid making promises I can't keep! This includes not offering services that I cant follow up with! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New/ Good Home! So I'm involved in saving Orphaned Atari's from Atari Heaven! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!

Copied from similar topic on Tim's Atari group.

This is intriguing.....

Having just hooked up a TOS 1.02 STF, a Megafile 30 and a Seagate 48mb SCSI
using a link 1 I can report that either AHDI, v6.06 or ICD 'The Link'
software
both work.

AHDI is dreadfully slow, as always, ICD pops up quite smartly, shows the M30
as an Adaptec unit, the Seagate as an 157 and shows the partitions enabled.

The desktop will depend on the .INF file on the boot drive/floppy, it will
not show the second set of icons. These will need installing.

The Megafile should burst into life at power up. No half hour waiting!!!!

Listen for both the fan and the drive spinning up. If you can't hear the
drive, temporarily block the fan.

If it don't spin up.....

Let it stop wittering then switch on the ST. Start the second (SCSI) unit
before the first (megafile).

Or press reset once all are fired up.

Barrie. www.keychange.co.uk

> From what I understand, the ICD driver software included with the Link
works

Not true, see above.

> Also, I understand there are some DIP switches on the Megafile (haven't
> cracked it open yet). I assume I'll have to turn termination OFF there.
Is
> that switch marked so I'll know what the hell I'm doing?:-) TIA,

Leave all the switches as is unless you need to change the unit number,
which, at present, you don't.

Set the SCSI drive ID to 2.

Hi Galen

> Termination is part voodoo.

No its not, rules are rules.

>Since the ST doesn't have internal termination

Of course it hasn't, its not a SCSI device.

> (as opposed to the TT, for example), a two device SCSI
> chain should have BOTH drives terminated.

Wrong, the start and the end of the chain should be terminated, i.e. SCSI host <=> last device.

>That said, my STe refused to play by the rules, and its four device chain had only one
> terminator -- a through terminator placed BEFORE the fourth device.
> Go figure.
>
> One last note. Old SCSI cables can drive you crazy. If you can't get
> it to work no matter what, it's probably the cabling.

What's age got to do with anything, most of the materials are a few billions of years old?.

Barrie,

Thanks for the reply!

I'll try setting the SCSI drive ID to #2 as you suggested. It's presently at 0 ands the Megafile is #1. I did muck around with the DIP switch in the Megafile but I'll put it back to where it was.

Still curious about the termination issue. Is this a factor with AHDI? I used to use the Megafile by itself and it worked fine but since it's now in the *middle* of the chain, termination should be off, shouldn't it?

Also I'm slightly confused by the different terminology. Is "unit number" the same as SCSI id? And the "bus" number--I assume that BOTH drives will share the SAME bus #, like on a regular SCSI machine with multiple buses but more than one drive on each.

Actually the Link s/w does work with the Megafile, though the ICD docs say otherwise.

> I don't know if HD Driver will work, but it is widely considered to be
> the best software available. It is commercial, and the author himself
> frequents this group.

I found it and downloaded the demo. It's restricted in that it won't see more than the first 4 partitions of a drive but that should be enough for my needs. Still, the same problem as with the ICD software: each drive can be seen individually but not together.

> On the other hand, if you don't intend to use the Megafile much
> longer, you might want to just copy to floppy. A one-time only
> transfer of 40 disks wouldn't take more than a couple of hours.

Yea that might be the only way to do it. I wonder if I'll ever find any DD floppies anywhere though :-)

I was also thinking about a null-modem transfer through serial ports to my Mac, then back to the other drive. If I could figure out how to do it, it might be something I could just leave the computers on all night to do; better than switching floppies :-)

I have a terminator somewhere I can try.
>
> One last note. Old SCSI cables can drive you crazy. If you can't get

I haven't ruled out one of the cables (the short one I use to daisy-chain the Link & SCSI drive). Someday I'll get it all sorted out, thanks!

Robert

BAK>Set the SCSI drive ID to 2.
Keep in mind that AHDI scans the chain beginning at 0 upwards and will stop when it finds the first ID with no drive corresponding to.

No you are wrong and SHOUTING only only goes to show how ignorant you are!,
also you suggest this person does as you say you did, " download " and not
extract from his own machine, this would lead and suggest to others that to
own an Atari is not needed and that thousands of copies of the OS can be
distributed willy nilly by French people or other people who are not
British, if everyone carried on like this Atari would loose millions and
probably be forced out of business by French People or People with french
or non English sounding names, your spelling of Sherif is also wrong and by
the way we don't have sheriffis in England They come from America which
thankfully are not alowed on this Ng

There is no moderator here, if there was, probably alot of posters here
would already be gone.

What's all the hoopla about. TOS roms get copied all the time, they are all
over the web. Maybe I care, maybe I don't. I can't stop it, I doubt much
Atari in it's present form really cares anyway... or some ISP. My ISP
had this reaction. What is "Atari"? We don't support that...

The views of spnuk don't necessarily reflect the views of hrmm.. anyone.

Atari in it's present form doesn't give two hoots. In fact last I checked
the rights to TOS were sold to Milan which is doing SO much these days.
Downloading TOS from the internet... illegal if you don't already own a
copy. But the way these things work is that if you DID own a copy and it
was DESTROYED which TOS chips happen to have nice aging pins that fall off,
etc then you are allowed to replace those chips with your own backup copy.
The law is a bit sketchy about this but honestly. It's 256k of code.
woooowee.. Chances are the person needs a copy of TOS to burn to ROMs or
roms themselves, it means he has an ATARI MACHINE which probably shipped

with TOS 2.06! Logic suggests that he by definition then owns a legal copy of it for that machine. Circumstances that might different from this are in my situation where I bought a bulk of Mega STe motherboards. And honestly, I don't care who comes to get me, I will use Eprom copies of my legally owned TOS 2.06 to get them working.

Spnuk you're the one who is ignorant because A: Atari won't care and the Atari that would have cared went out of business a looong time ago. B: this newsgroup doesn't have a moderator, and C: most ISP's have MUCH more important things to worry about then someone illegally burning a copy of a 256k total size 9+ year old OS. These laws really matter for projects like Aranym or with shipping a commercial product. That's where injury can happen and that's where lawsuits can come into play. And why would you yell at someone who wants to burn a copy of TOS to get an authentic atari machine running to do - who knows. Maybe he's the programmer who will rewrite MiNT to finally have virtual memory. So that finally we can have dynamic libraries - so that in the end something like running gnome for vdi might be feasible. You never know what you're doing until you think in the big picture ;-)

Anyway, I suggest valium. Really helps with these matters ;-)

Hi all,

I had posted a topic some days ago, about a broken 520. I have the machine now with me.

It is actually a 520STE. I've connected the TV out to my TV cards antenna connector, and I think I got a signal from the ST in channel 32. However, I cant make out anything, just that it gives something when turned on, a what it seems - white screen.

There are 4 simms. I presume that's the memory, seems to be tight fit into place, although the top-most simm slot has a pin broken.

There are some wires going from a chip labeled "68901P" to some other chips next to it. What's the reason for this?

There is no floppy activity.

All of the chips on the mobo seem seeted ok on their slots, and the board is in a good overal condition.

Anyway, I'm guessing the problem lies in one of those memory slots, but I need some advice from you.

Any ideas on how I can get this beast running will be very much appriciated.

Thanks,
MrZammler

if my english spelling in wrong, what about your french and your
bullshit email address ?

Hummm, it looks like you are at war with french people, old history.
Maybe you faggot are still afraid of being invaded ? Napoleon had no
tunnel to ride through, but we built it, be careful !!!
And do not worry, we have much nicer people than you to talk with like
Irish people. Yes, had you forgotten your vallium yesterday ?

Everyone takes its responsibilities, I have the usage rights for a TOS
2.06, and everyone who nowadays would make copies, even illegal ones,
has only one thing in mind : Atari REVIVAL of a dead society!!!! not HACK !

And I am not sure what the law would say if this guy already owns an STE
equipped with TOS 1.6x and would upgrade it with 2.06. In opposite to
the present Microsoft Windows OS wich has a real new OS each year, the
ATARI TOS was more seen as an improved system for the machine you
already own.

The best in this poor message exchange, is that if you look for Atari
Roms in the net, were would you most probably land ? Guess ?
Well, in the UK for sure: http://www.atari-roms.fsnet.co.uk

Hey bobbie, have a rest.

I installed the Dutch version, but first got a series of error messages
complaining about errors in the syn_cfg.qed file. But after selecting
"Opties > Parameters bewaren" to re-save my *.qed configuration files
everything is back to normal again - maar nu in het Nederlands.

Hello Mark,

I am sure there are Atari computers today still being used for
MIDI. Alot of people know that having a computer with built-in
MIDI is much better than ones that have to have MIDI added as an
attached card. I have some CD's that were done using a ST. Kind of
neat. People say Atari is dead, but do not realize how many users
out in this world still use them...

Hello,

I use the latest version of aFTP. Works great under MagicNet and
MintNet. It sometimes crashes my Hades under Magic if I try and
close the box that is up on the screen that says "connecting". Now
I just stop the program by clicking on it's icon in TaskBar...
Other than that, I have no problems...

That could be the problem if that SIMM is in the #1 position. The
STe should run with either 1, 2 or 4 1-meg SIMMS.

>there is no floppy activity.

Not even when you first turn it on?

It may be a loose chip somewhere. You may want to just press down
on all of the chips/simms. I have gotten some ST's to work doing
that.

Indeed. I got this at the beginning too. Now Qed runs smootly again. I
only wished the current version was a little bit more stable.
Qed crash sometimes when I do cut/paste or even just copy.
ps. the same happens with the html editor Joe.

My 2 cents:

Although I don't use it commercially, my Mega 4 (TOS 1.02) is still
running my studio since 1987 without a glitch! It's 720k floppy is plenty
for MIDI files since they are small. The Mega is one heck of a work horse!
I use a Falcon to record to CD.

Mr Zammler's address doesn't reveal where he is. I suspect though that it's in Europe, where output is normally on Channel 36 UHF. Although some European countries use VHF for TV, the UK for instance no longer does. In the US (and perhaps other NTSC countries) it was usual to use low VHF channels, as you suggest.

The same applies in general to VCRs and STBs etc. I think.

What exactly do you mean -is is the SIMM that has the problem or the slot?
If it's the SIMM itself just take all four out of the ST and plug one or
two good ones in... If you're interested I have two 256k SIMMs left from my
1040STe -and I'm in Athens.

Kalhmera :)

You can use Vassiliss' FTP Server if you also run MagxNet (both from his web site). If you have file sharing on a Windows computer you could use his Samba port instead for LAN use.

Cheers

It's the slot that has the problem. It is the one closer to the back of
the machine.

541. Ultimate Virus Killer - Atari ST/TT/Falcon virus killer

Newsgroup: comp.sys.atari.st
Date: 2003-01-26 14:42:44 UTC
From: Richard Karsmakers <sorry@no.spam>
Message-ID: <ius73v4g4o53ptcrog5g7vv6btnpf9he1t@4ax.com>
Source record: 29523
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for about 14 years, and turned shareware a while ago. The latest version, 8.2, was released October 10 2001.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

542. STNICCC - Atari 16-bit Scene Reunion and Database Central site thing...

Newsgroup: comp.sys.atari.st

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000? Or were you an otherwise active member of the aforementioned scene?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

As long as there are no reports of new viruses or other new bootsector-using
software, it is still quite up-to-date. Hopefully it will remain up-to-date
forever (meaning there will be no new viruses on ST/Falcon/TT/whatever) ever.

Yes there should be something. I hope you have bad drive and not a
bad floppy controller. Check the connections to the drive just to
make sure.

Hello everyone,

I recently acquired what I think is the latest version of Taskbar. It is a great program and I now favor it over MultiStrip. There are some things that need work like the icon option. Taskbar lets you assign an icon to anything that appears in the taskbar. This works fine except when I run some of these programs the icon does not show up until I run the taskbar configuration option and then click on "apply" with the option to show icons highlighted. Also, if I run Cab (which I have an icon assigned), quit Cab and then run something else, what ever I run has Cab's icon next to it. I can fix all this by again using the taskbar configuration option. Anyone else has this happen to them? I am using Taskbar under Magic.

Hello,

The author of MagicNet contacted me and apologized for not answering my as well as everyone else's email. Seems he was having some proglems. He emailed an upgrade beta version of Magic that he hoped would work with Ozk's new NEC ethernet card driver. It partially worked. The new driver plus the present version of Magicnet used to crash my Hades, but with this beta version installed, the Hades booted up fine. I just could not connect to the LAN. Hopefully things will get ironed out and the author will release a finished product. Nice to see he is still on the job.

Yes,

But I'd like to see sources for MagiCnet or find out what it took to get it
to happen. Since there's no MiNT kernel I guess it is just the mintnet api
ported to magic. Interesting, it would be nice to see mintnet libs for
purec. Anyone know if it is possible to program for STiK using Gcc/mint?
I have been unsuccessful thus far.

Thanks,
Mark

This last sentence explains everything... Although I have a version of MagiC somewhere, it will not run on my Milan so any tests with MagiC is very difficult. I would not expect Taskbar to work properly on anything but MiNT/N.AES (if that...) and maybe XaAES. There are a few things that has never worked properly under MagiC, icons is one of them.

I managed to interface STiK to GFA, I would hope GCC could be made to do so. Actually all you need to do it port the wrappers for the functions and bingo. I could probably do this in GCC with a little time, but I don't use GCC myself so my level of motivation is not so high. I'm certain it's doable though. ;-))

It's been ages since I looked at the original stik devkit, everything you need is there in "C" already, it just needs tweaked for GCC. Actually it was harder to make it work under GFA cause I had to port the "C" backwards.

The rules for correct termination are not a software issue. The first
and last *physical* devices of the SCSI chain (i.e. the two devices at
the end of the cable) must be terminated, any other device must not be
terminated. That's all and it's the same for any platform.

My mistake. I meant *ACSI*, not *AHDI* :-)

The question remains, however you seem to have answered it ("same for any platform"). So ACSI is similar in termination needs to SCSI, correct?

Do you or anyone else know where termination is controlled on the Megafile 30?

tx,

Rob Aries

Go ahead, I haven't lived there in 18 months. Even if I did find a pile of
horse shit on my front door I would...

1. Use it to fertilize my garden
2. Give the relevant authorities your email and your friends details

Have a nice day.

I am not sure if I understand that sentence. But if you mean the Atari was designed to avoid viruses, um, it wasn't. It could have, though, quite easily.
Don't know about any of the new TOS incarnations. Maybe the programmers took care of bootsector viruses at least.

So far I never have encountered the long text problem only that very
annoying cut/paste, copy problem.

Yes I did tell the author about this problem but it seems he has no clue
what's wrong.
I wonder if qed and Joe uses the same libraries

I also looked at your GFA code and with some modifications it is usable
with STinG as well.

I began writing a Ping utility program and got it working well including
the call-back function to fetch the returning ICMP packets via an
Assembler inline.

I had plans to write a graphical "connection status control tool" with
Face Value and GFA but never finished it. Partly because my old Face
Value copy has some bugs that I guess newer versions don't have... It's
hard to locate and buy updates these days...

It should work as is with sting, but if you refer to adding additional code to support some of stings extras, yes that is correct.

I also have an older facevalue which I never used. You can get updates from run software, but last I inquired there was no English version. My old one was English at least.

My old STE, and before that ST, was remarkably virus free. I can only
ever remember seeing one, from an infected magazine cover disk I think,
and that was more of a prank.

Happy daze..... :-)

Cheers,

Roy

More than I care to remember! :-)

I doubt that many have been written, let alone released, in recent years for the Atari platform. Even when those machines, very nice in their day, were at their zenith, relatively few viruses were directed at them compared to Wintel machines, I think, which even then (late '80s/early '90s ?) were heavily under attack. And they mainly arrived via infected floppies.

I quickly learnt to be very careful indeed when I switched over, and I'm on line (and therefore potentially more vulnerable) far more than I was on my Atari. Did you ever use a BBC 'B' on line by the way? An entirely different experience given the then speed of modems, not to mention the cost of the phone call for ever ticking away in the background!

Cheers,

Roy

In theory, I agree. In reality, I've had to break the rules a few
times to get things to work.

Does the Link have terminators? I'm not sure, to be honest, but I
don't think it does. If not, my statement and yours are identical as
concerns the Link. BTW, I agree with you.

> > One last note. Old SCSI cables can drive you crazy. If you can't get

I really don't know the reason, but SCSI cables tend to be fragile. I
refuse to move mine, and I've encountered two cases when cables that
worked prior to disassembly did not work after reassembly. Since the
cabling is simply a bunch of insulated wires, it must be something to
do with the connectors. Regardless, I tend to suggest trying new
cables as a last resort, even if they worked 'before'.

It is difficult to spot irony in emails...
There has been no reason to update the UVK because there have been no *new*
developments since (not on the virus front, anyway). I could update the
actual release date text every once in a while if that makes people happy :-)
I challenge you to show me another virus killer on the Atari that's been
updated the past 5 to 7 years...

This is backwards. MiNT existed long before MultiTOS, and has always
been free software.

Andreas.

Hi, Richard!

I think it's time to talk for those who usually keep their mouth shut:

I am glad to see UVK still being supported - even if there has not been
the need to "update" it for such a long time.

I am glad about your really informative UVK-Website.

I am glad that you don't take those silly postings seriously.

Regards,

Alexander

well, doubting thomas, i guess you're in for a surprise... there are a number of free anti-virus products for intel machines, all of them updated regularly... f-prot for dos is free for personal, non-commercial use... avg is another...

588. CD-RW on Falcon

Newsgroup: comp.sys.atari.st
Date: 2003-01-29 14:54:33 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3E37EB29.6A920A2D@siemens.at>
Source record: 29668

Hi,

Some weeks ago I put some files on a CD-RW on the PC to transfer them
to my Falcon. The CD-RW was not readable there. When I put the same
files on a CD-R I had no problems reading them on the Falcon.
Somewhere I found a hint that some old CD-Readers are not able
to read CD-RWs. This could be the case for my old 2x CD.
But does anyone know if it definitely is a hardware issue and I could
read CD-RWs with newer hardware or if it is a driver problem ?
Is there any software to even write CD-RWs on a Falcon ?

Thanks
Gerhard

It's definately the reader. Replace it with a more modern 16X reader of
some sort and your problems will be solved.

Mark

That tells us what exactly?
Some numbers here and there.
How about a comparaison between this and a TT, or Falcon, or Milan.
How much faster is it with the SDRAM as opposed to without?

Numbers like this don't mean a whole lot to me to be honest,
just like me saying:
"You should hear this song, it goes, Am, C, C, G at 95Bpm...."
Anyway...., I hope it is plenty fast...

I think it has nothing to do with "modernity", as there are still
recent CDR drives that are unable to read some formats.
So, rather than looking after modern or not, search for a drive that
can read CD-RW as well.
For CD burning, you could use Anodyne's CD-Writer suite, along with
Extendos Gold - they're great, though not completely finalized.
You then could burn CD-Rs as well as CD-RWs, either audio or data,
though you could experience problems with 700 MB CDs in some cases
(I lost more than 20 CDs, and I thougt it was because of my Ricoh
MP6200 drive. I then replaced it with a Yamaha CRW 4260t, and I had
the same problems. So I think it's CDWS that is having problems with
700 MB CDs).

Hi,

This is some results with the SDRAM on the CT60:

NemBench v1.0 - precision CPU/FPU profiler.
TURBO mode 640 x 400 x 2 colors (72 MHz)

Integer multiply (16bit) -> 36.571 Mips (~5937%)
Integer divide (16bit) -> 3.261 Mips (~898%)
Linear (stalled) integer -> 96.376 Mips (~1207%)
Interleaved (piped) integer -> 143.719 Mips (~1800%)

Float multiply (64bit) -> 24.094 MegaFlops (~9092%)
Float divide (64bit) -> 1.969 MegaFlops (~1138%)
Linear (stalled) float -> 35.617 MegaFlops (~6682%)
Interleaved (piped) float -> 35.617 MegaFlops (~6695%)

16bit read (100% hit) -> 141.843 MByte/sec (~1799%)
16bit write (100% hit) -> 138.888 MByte/sec (~2323%)
32bit read (100% hit) -> 285.714 MByte/sec (~1813%)
32bit write (100% hit) -> 277.777 MByte/sec (~4183%)

Linear 256k read (STRam) -> 6.866 MByte/sec (~130%)
Linear 256k write (STRam) -> 7.150 MByte/sec (~112%)
Linear 256k copy (STRam) -> 3.517 MByte/sec (~110%)

Linear 256k read (FastRam) -> 74.898 MByte/sec (~1422%)
Linear 256k write (FastRam) -> 68.604 MByte/sec (~1076%)
Linear 256k copy (FastRam) -> 28.870 MByte/sec (~902%)

It's good, no ?

Didier.

Agreed. I'm also glad to use a platform with no new known viruses via
email or web or even bootsectors for several years! And still benefit
from very capable news/mail clients!

>I am glad that you don't take those silly postings seriously.

Nothing to bother about. He has probably been infected rescently by using
unsecure online tools and feels frustrated that we Atari users have next
to no problems with viruses :-)

On the other hand I do know a way to buffer overflow my email client just
by receiving an email composed in a special way. I have not (yet...)
tried out if it is possible to inject runable binary code into it to
write the first email virus in the Atari world. Probably will not work as
the executing program runs at a lower RAM address than the data buffers?

Hi,

JG>But does anyone know if it definitely is a hardware issue
I do think so.

JG>Is there any software to even write CD-RWs on a Falcon ?
CDRecorder is able to do so, and I suppose the anodyne soft will do it, too.

After you'll have bought a writer, you will have solved both your problems, for the write will read RWs anyway.

>> with STinG as well.
>
>It should work as is with sting, but if you refer to adding additional code
>to support some of stings extras, yes that is correct.

You are correct. What I did was simply to add a few functions for the
STinG way of handling ICMP packages:

In @init_stik:

icmp_send_%=LONG{tpl_%+140}
icmp_handler_%=LONG{tpl_%+144}
icmp_discard_%=LONG{tpl_%+148}

And just two new functions:

FUNCTION icmp_send(rhost.%,type.&,code.&,buf.%,len.&)
$F%
type.&=SHL(type.&,8)
code.&=SHL(code.&,8)
RETURN C:icmp_send_%(L:rhost.%,W:type.&,W:code.&,L:buf.%,W:len.&)
ENDFUNC
FUNCTION icmp_handler(handler.%,install_code.&)
$F%
' install_code.&:
' #define HNDLR_SET 0 /* Set new handler if space */
' #define HNDLR_FORCE 1 /* Force new handler to be set */
' #define HNDLR_REMOVE 2 /* Remove handler entry */
' #define HNDLR_QUERY 3 /* Inquire about handler entry */
RETURN C:icmp_handler_%(L:handler.%,L:install_code.&)

Added to this an Assembler INLINE that STinG calls when an ICMP package
arrives. This routine adds a note with timestamp to an internal buffer
and sets a GFA flag variable.

The main program then checks the flag variable regulary and when flag set
fetches the data from the Asm buffer. Based on another example from your
site, I think.
```

Does seem to work fine but I have not worked on it since April 24'th
2001...

Anyway, your library was a great help!

>> I began writing a Ping utility program and got it working well including
>> the call-back function to fetch the returning ICMP packets via an

>
>I also have an older facevalue which I never used. You can get updates
>from run software, but last I inquired there was no English version.
>My old one was English at least.

I'm still on English Face Value version 1.x too. I had a look at
http://www.run-software.de/start.htm and I'm really tempted to upgrade.
Fortunately I do read German with some difficulty but an English version
is far easier to use.

My original GFA manual is actually in Swedish so no problems there... :-)

Look at the bottem of this post, it's a FREE virus guard and I update it weekly
too for free. Dumped nortons when it didn't catch ones that this one does.

> Anyway...., I hope it is plenty fast...

Someone please correct me if I'm wrong, but here's how I would interpret these numbers. I'm of course assuming these are in comparison to a standard Falcon. Since the CT60 would initially only work on a Falcon, it would be silly to compare it to anything else.

>> Integer multiply (16bit) -> 36.571 Mips (~5937%)

... means the speed at which the CT60 running at 72MHz multiplies 16-bit integers is 59.37 times that of a standard Falcon.

You can plug the rest of the numbers and names of tested items into this sentence and get the results I think you're looking for. And as far as the ST-RAM vs. SDRAM speed, those numbers are near the bottom. I assume the rest of the numbers are either with SDRAM or the memory type doesn't matter, as it they are things done within the CPU itself.

Having said that, there is something I *would* like to see other than this that would probably help answer your questions better than this. Now I know I'm going to get flamed for this by some members of this group, but...

How about giving us some GEM Bench results on the CT60? I know they supposedly aren't as accurate as the Nembench results, but from a purely user standpoint GEM Bench gives a better idea (IMO) of how the system as a whole will react with the card. An example...

I have a Nemesis in my Falcon. When I got it, I wanted to see how it would affect how my system runs as opposed to the stock Falcon. Nembench only told me that the CPU was running at exactly 125% or 156% over a stock Falcon. Well, duh! I knew that info without even running the program because 20MHz is 125% of 16MHz, and 25MHz is 156% of 16MHz. But that told me nothing about how separate OS, graphical, etc. elements of my system were reacting. GEM Bench, although maybe not as accurate, gave me a much better idea of what I was looking for when I compared my results in each mode with my results with Nemesis turned off (never go by the default Falcon comparison built into GEM

Bench if you want to see how an individual OS compares to itself at a different CPU speed, unless you only use TOS and a clean system all the time).

So, I personally would like to see GEM Bench results *in addition to* Nembench results to give a more well-rounded picture of how things will work with the CT60. And I think it will also answer your questions better as well. Just a thought...

NemBench = 100% with a stock Falcon at (I think) 2 color mode. It tests mathematical calculations (needed for things like playing MP3 files) and ram accessing, which is much of why you'd want a CT60. Anyhow, I've posted some results of a stock Falcon running at 640x480x256 below. If you notice, the stock Falcon isn't quite at 100% due mostly to the added colors, but it's in the ballpark.

For what it's worth, Didier's numbers suggest that the CT60 will be as good as a Medusa using the 68060 chip, at least as far as mathematical calculations and accessing RAM are concerned. Your other functions (like video) will still be about the same since the CT60 doesn't deal with those directly (although one should be able to use higher resolutions without the computer slowing down noticably, which now happens with the Falcon). Some Medusa/Hades 060 numbers are also posted below, although the video resolution is not stated.

What I don't know is how much faster the Falcon will be on your favorite program. I suspect the CT60 will (as an example) spellcheck your 100 page document much faster than the stock Falcon, but I don't know how much faster. That depends on several variables that aren't completely dependent on the CPU.

You mean to say that you produce a PC virus killer on your own, on a
platform that has hundreds of new viruses per week? Well, good luck. If you
do that for free you're a saint.
I was asked, in 1994 or something, to make a PC virus killer as well. At
that time, there were something like 6000 viruses on the PC. To start making
that virus killer, I would have to spent months and months just analyzing the
viruses, describing them, building recognitions for them. At the time I still
went to university, so it didn't happen. Now there are almost 63000 viruses.
You need to have a whole team of people to update that, like I said, with
hundreds of new viruses per week.
On the Atari platform, by contrast, there are somewhere between 100 and 105
viruses in total. Almost all of these are the easy variety (easy to spot,
that is), i.e. bootsector viruses.
I am surprised you can find the time to even send an email message, if
you're supporting a PC virus killer in your own time, and at no charge
either...
Frankly the sheer logistics and time problem involved can lead me to no
conclusion other than that your virus killer can't possibly be any good. I'd
surely like to hear more about it: Convince me!

Hi, I'm Ben Smith of Bravo Sierra Computers. I sell Atari Computers and Atari Jaguar Games. The Great Communicator once said, "It's a Recession when It's in your Neighbor's back yard. But when It's in your back yard, it's a Depression!". I've been waiting for Customers to follow through on their Atari Orders. Some people begin an order, then neglect to follow up in E-Mail while I wait for their reply. I could sure use your Business, I welcome all the Atari Busines I can get. Right now Times are Tough for the Atari Business, so to all my Customers, now is the time. Now, I'm updating my Catalogs as well as adding to my Catalogs. Especially my ST Software Catalog which is the PHATtest it's ever been! Over 100 KBytes! Bigger than ever! E-Mail Atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and earn your Business!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, I avoid going into debt and I avoid making promises I can't keep! This includes not offering services that I cant follow up with! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New/ Good Home! So I'm involved in saving Orphaned Atari's from Atari Heaven! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

> 700 MB CDs).

Are there special options or is the only difference whether you
put a CD-R or a CD-RW in the burner ?
I suspect that not all burners are able to write to CD-RWs, right ?
BTW, for normal CD-Rs I also rather use the 650 MB types because as
far as I know they have longer life expectancy.

610. Porthos 3 vs 2

Newsgroup: comp.sys.atari.st
Date: 2003-01-30 10:22:45 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0301301117390.132-100000@easymint>
Source record: 29690

Hi,

I've been using a registered version of Porthos 3.03 for some time now and I have noticed that, though there have been improvements compared to version 2.x, I still need version 2 installed on my harddisk. Once in a while I come across PDF documents that look bad or even are completely messed up and unreadable with version 3, while Porthos 2 shows them perfectly.

I have informed the author about it, and I'm sure he will try to fix it. Is anyone having similar problems ?

612. [UPD] February Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-01-30 12:56:20 UTC
From: François LE COAT <lecoat@netscape.net>
Message-ID: <3E3920F4.9050407@netscape.net>
Source record: 29692

```
Hi all,

My software "Eureka" is updated and released on its WEB site.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka302.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

There's correction of many bugs, and optimisations in speed.
But you will also notice that the "Lite Edition" is now
entirely translated in English.

I wish you big fun with all this STuff !

Regards,

-- Franï¿½ois LE COAT

All recent (multiread) drives should be able to read CD-RW.

CD-RW disks are not written with the same filesystem used on normal CD-ROM
disks. CD-ROM uses ISO9660 filesystem (with some optional extensions,
like RockRidge, Joliet, and some others), and CD-RW are read/written
using UDF filesystem (which is also used for DVD disks). It seems there
is no UDF fs driver for Atari (be it for Metados or MiNT). So you won't
be able to read the content of a CD-RW disk on Atari, even if you have a
recent drive.

It is absurd how it hasn't occurred yet to some that perhaps the reason for the lack of business is a largely angry customer base that doesn't want to do business with him. *sigh*. He's digging his own grave.

The same happens here too. From time to time I encounter pdf's which
are totally messed up. I haven't thought about it to check if they
displayed correctly with an older version of Porthos though.

16 MHz.

But there are a little problem, Rodolphe said than normally I must
obtain 140 Mbyte/s here:
Linear 256k read (FastRam) -> 74.898 MByte/sec (~1422%)
Linear 256k write (FastRam) -> 68.604 MByte/sec (~1076%)

Didier.

Same here.
In fact, I still have CAB set up to invoke the old one,
so I hardly ever use Porthos 3. When they fix it,
I'll switch.

Hi Patrice,
Unless I misunderstood your comment, I can see a directory and access
the files on a CD-R/W disk made with my Falcon/Yahama CD R/W drive using
Extendos and one of CDWriter, CDISO or CDBackup through Session CPX. There
may be a setting in those programs like "Finalize for CD Extra" that may
or may not hinder seeing a DIR (not sure about that though).

Hallo Janka,

�Somewhere I found a hint that some old CD-Readers are not able
�to read CD-RWs. This could be the case for my old 2x CD.
�But does anyone know if it definitely is a hardware issue and I could
�read CD-RWs with newer hardware or if it is a driver problem ?
�Is there any software to even write CD-RWs on a Falcon ?

CDr or CDrw are transparent for the software, it's only a matter of
laser light.
If your drive can't read CDrw there is nothing to do, he is simply to old.

I don't think so... I actually had the pleasure to buy from him right
before christmas, partly because of his posts to this NG but also because
of yours and others unfair complaints about his ads here.

Got a couple of hard to find items and yes, his service is excellent!
Some might think twice before sending cash in advance to remote
continents but with Ben Smith there is no need to worry. Just remember to
use insured mail when sending money.

He kept his promise about "quick turn around time" and I got the items
here as fast as the postal system permits by "Global Priority Mail" at no
extra cost.

So the fact he has updated his catalogue is certainly good _news_!

Yes, and Anodynes Extendos and CD Writer suite handles both CD-R and CD-
RW for reading and writing perfectly including erasing CD-RW.

I have actually burned some downloaded ISO files with PC programs on my
TT to CD-RW at 4x with Anodyne's programs and then used them to install
programs om my PC.

Hallo Janka!

JG>I suspect that not all burners are able to write to CD-RWs, right ?

That's right, but would apply only for rather old ones.

otoh, I've got a yamaha 4260. This one is supposed to write both cd-rw and cd-r, and did so for some time. But then I got write errors with normal cd-r's, whereas cd-rw's still can be written without trouble. I guess it might be some hardware issue (aged write LED or such).

Reading a CDRW is simply a matter of sensitivity to the laser as a
CDRW is not as reflective as a CDR. This is why many CDROM and CDR
drives of the past cannot read CDRW disks.

> All recent (multiread) drives should be able to read CD-RW.

Mostly agreed. There may be a few cheap CD players that can't, but
that would be a tool for listening to music, not for your Atari.

Yes and no. One CAN use optional filesystems on a CDRW to make it act
rather like a hard drive (read and write whenever you wish). This is,
as noted, not currently possible on an Atari. CDRWs can, however, be
written with ISO9660 like CDRs, and when this occurs the CDRW acts
like a CDR you can "wash" clean of all data and reuse.

That's not correct. I've never written CD-RWs with an UDF filesystem.
One can certainly do so, but there is no need for that. You can use any
filesystem that you can use on a CD-ROM for a CD-RW. Usually you don't
have any coupling between the media and the filesystems at all. one
write Joliet data to a hard disk drive, as well as ISO9660 etc. Just as
one likes.

Damn, you confirm what I thought :
I have a Yamaha 16 10 40 for 1,5 year and noted that he read with more and more difficulties, then he couldn't wrote correctly : audio CDs could be played but list of songs seems bad written and couldn't be read by any CD drive.
I accused the software, then the cable, but now I'm sure it comes from the CDdrive.

If some other would confirm the same trouble I will never more buy a Yamaha computer stuff.

Well, Yamaha recently annonced not to produce and CD writers anymore. So
even if you wanted to, you would not be able to buy from them, at least
not as far as CD writers are concerned.

Yes, there is a cookie for that setting, but not all apps/desktops use it or are even aware of it.
There was a CPX for setting the date/time cookie.
I don't know if 2.06 will dynamically adjust to the cookie though.
I forget who made this CPX atm, if you can't find another solution I can look on my TT for it. I think I had it installed there at one time.

:-) Thanks but remember although apparantly it's only me who maintain
the R.M.A. server there are other people involved.
Many thanks must be addressed to a former student of the R.M.A. Karl
Samyn aka Saka. That's the guy who started up the server many years ago.
Without him there wouldn't be an Atari server at all at the R.M.A. Also
Saka arranged the Atari ftp-section stayed alive after he'd left the
academy.
Also many thanks must go to the student who is responsible for the
ftp-server.

My problem isn't reproduceable too. It seems to happen randomly. I'm not
a programmer but my guess is that such bugs (?) are very difficult to
track down hence it take so long before Heiko Achilles finds a cure.

There is a cpx you can use to control the date format.
dateform.cpx from Harald Becker (1997).
It's on the Belgian ftp-server.

I have the same problem. Text in some PDFs looks like it has been through
the Enigma encoder so I resort to using 2.05

I have reported this to the developer and sent some samples but heard nothing.
I can't imagine that it is a major problem since it was working in 2.05

Personally I am not bothered about text and graphics export features I would
just like Porthos to be able to display most PDFs.

Hm, this just happens to be the standard _Swedish_ way of representing
dates! That is: Year-Month-Day.

To me it seems extremly natural with the exception that we normally don't
use the "-"-signs. I have actually written today's date as "030131" at
least 20 times today when signing papers with my favourite "Ballograf"
pen. It's been in use since at least 1995!

The [North] American way of writing dates is very strange: Month-Day-
Year. The fact that English and North Americans use different ways is
really frustrating as you can't tell which from the language alone.

Hi Hallvard!

No it's not the US way - it's the ISO way: Year-month-day, while
the US way would be month-day-year! It's to overcome the US/Europe
difference that ISO, the world-wide standardisation body, adopted
the third way.

But generally, to me too the European day-month-year is
preferable, since we are used to it. No idea how to change it,
except on a Falcon where the date format is stored in NVRAM.

BTW, the ISO way can be useful if used as part of filenames, as
the files will be sorted correctly by date on the desktop and file
selector even if using 'by name'.

I did, there's 3 small DIP switches on a single block. From my experimenting, it seems that the leftmost two control the unit #, letting me set it between 0 and 3. The rightmost switch is termination enable then?

I haven't had time to work on this further, I'll just try it both weays and see what works.
>
> RA>So ACSI is similar in termination needs to SCSI, correct?
> IIRC the adpter is to be terminated and the last device hooked to this adapter
> as well.

The Megafile is in the middle of the chain. After it comes the Link, attached to a SCSI drive. I'm not sure if the Link itself is terminated, or whether that is set on the SCSI drive. Once again I'll just try different things and see what works.

Not really, but I have not been loading alot of PDF's lately.
Version 3 seems to be doing the job just fine.

I can agree that Taskbar may be having problems with Magic, but
for the most part, icons under Magic have been doing very well. I
have not tried it under Mint/N_AES, but I will. Thanks for the
info.

That's interesting. I actually have more uses for my Atari than I do for my iMac. I have much more fun using it, and have a ton more software running on it. If it had a better web browser and could print in the highest resolutions my printer is capable of (for working with digital images and photos), I would have absolutely no need for the Mac at all! My Atari would cover everything I need.

So please leave me to *use* my Atari in peace, thank you.

And as for the virus issue... please show me a virus that isn't covered by UVK2000. There's a reason why no virus-killers have been updated recently... no need!

Yes, i used SBIII long time with MagiC and NVDI. First boot MagiC, start
NVDI, after then SB-Software. SBII or III. Itï¿½s better to use SBIII
Software. With MagiC SBII canï¿½t found the path for SBII display data.
(SB Folder on C:/)

(It was an patch around Maus Berlin2 to fix this problem)

> problems with my Falcon locking up when saving to disk while running

If you got it running, change the resolution to the sitze you want and
save magic.inf from magxdesk. (Not on any other desktops)

> Screenblaster and Magic. It is running after NVDI and before Magic in my
> auto folder.

On any falcon here NVDI starts after SB.

I donï¿½t know where you can found SBIII Software.

All in all itï¿½s tricky to install SBII (III) on MagiC.

What is the difference between SB2 and 3. I have 2, and yes Magic then NVDI then SB2. Never had any real problems with it. Is the SB3 software avaliable anywhere? And is it compatible with sb2 hardware?

Hi Johan,

>This is not a reproduceable error, it happened just twice. I have to save
>the text more often and I hope to get around it. Next time I have to write
>down the adress of the error (MiNT + NewAlert).

The programmer develops QED under MagiC-PC, sending him MiNT address errors is
of little use. He's aware however of some bugs but can't reproduce them since
they seem to be OS specific...

In the mean time, take a look at Luna. Luna is freeware now, and contrary to
QED is developed further all the time. It has an overwhelming list of features
but far more important: it's rock steady.

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 02-01-03

HARDWARE

Atari 520ST Computer System. Unit is upgraded to 1 Meg of RAM.
Unit comes with mouse, power supply, floppy drive, and manuals
all in the original boxes!
$50.00

Atari SC1224 Color monitor in the box.
$40.00

Atari SC1224 Color Monitor.
$30.00

Atari SM124 Mono Monitor. Plastic casing is cracked on the
top left side, but works fine otherwise
$20.00

Atari SM124 Mono Monitor.
$30.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor
$250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The

software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$25.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age.
$5.00

Syquest 44 Meg Cartridges. These will be Atari HDX formatted
with no bad sectors.
$10.00

Syquest EZ-135 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

Syquest EZ-230 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $10.00 each.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk
$5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk
$5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks.
$5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Magical Math by Atari. The scholastic series math tutor program
starring Bentley Bear. Box, Docs, Disk
$5.00

Mickey Mouse The Computer Game by Gremlin. Help Mickey rescue
Merlin's Magic Wand in the enchanted Disney Castle.
Box, docs, disk.
$5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks.
$5.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks
$5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks.
$5.00

Planetarium by Atari. The scholastic series observitory in your
own house. One of the better if not best scholastic programs by
Atari. Comes with box, docs, and disk.
$5.00

Quartet Gold by Red Rat Software. 4 games in this box, Pengy,
Cosmos, Screaming Wings, The Secret of Steel. Pengo
clone, Galaxian Clone, 1942 Clone, and a graphical adventure.
Box, docs, disks.
$5.00

Renegade by Mastertronic. A Star Raiders type space shooter
type game. Manual and disk.
$4.00

S.D.I. by Mindscape. Complete with box, docs, and disks.
$5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks.
$15.00

MISC SOFTWARE

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk
$5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.
$30.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk.
$3.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk
$5.00
MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.

This is a boxed Atari version and not the pack in with the Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk
$3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk
$5.00

Thunder by Batteries Included. Sophisticated writing tools including
spell checker, speed-typing word expander & corrector, and statistics
on your document like the number or words, lines and more.
Manual and disk
$5.00

Time Link by Batteries Included. A time management software package.
Keep track of appointments and see them by the day, week, month,
or year. Manual and disk.
$5.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair
progarms that were infected. Manual and disk
$5.00

Wordflair II by Goldleaf Publishing. A very powerfull word processor,
desktop publisher, and document processor. There's almost nothing that
you can not do with the program. Requires GDOS or NVDI.
Box, docs, and disks
$10.00

WANTED

MagiC Mac Ver 6.XX or MagiCMac OSX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere

OTHER Platforms

I also have lists of software for other platforms like IBM DOS or
Windows,
OS/2, Mac, BeOS, NeXT, and Amiga. If interested please request a list.

It boggles the mind why more malware isn't written for
the vast Atari userbase. ;o)

The last Atari I had, had a cartridge port on top for
games, language, or math firmware I got more mileage
from my Commodore Plus Four, but I liked the sound
setup of the Atari better in some ways.

Uh oh.....shuttle failure.....bye

It's also relevent to note that the vast majority of virii are written to do damage to Microsoft-coded software like Outlook Express, Windows etc. Ataris seem relatively secure from the more serious and more aggressive virii.

Cheers
Al

Microsoft wanted to add more flexibility to their software by including a full macro language (Visual Basic for Applications). Unfortunately, this also introduced a potential vulnerability which has been exploited by most PC viruses out there. Unless I am mistaken (I do not use an Atari-based mail program, browser or newsreader) the Atari software titles features no macro language and are therefore, logically, not vulnerable to this kind of threat at all.
The only way to catch a virus on an Atari system, roughly, is by executing a file infected by a link virus, or by resetting your system with a bootsector virus-infected disk in the disk drive.

I have SB II and III, but III is a French language verion. SB III is
compatible with the SB II hardware. As far as I know, the hardware is the
same. I don't think it is available anywhere?? The company (Overscan)
still has a website, but nothing there about Atari.

I haven't been able to get III to work at all with Magic. SB II will
function, but it either slows disk writing to a snail's pace, or hangs the
computer. I have been testing this by copying a test directory. I have
tried sorting the auto folder about every way possible, and eliminating
all other programs, but I have the same result. It may be my particular
Falcon, which has been mounted in a Wizzronics Falcon rack, and I don't
know what kind of modifications have been done to it. I have had similar
problems trying to run Blowup or Videlity also. Things work fine without
Magic though (just GEM and NVDI works fine).

What hard disk driver utility do you use? I have ICD pro, and I think
this could be the problem. I think I will eventually try buying HD-Driver
and re-formating everything.

669. Nova VME Card drivers

Newsgroup: comp.sys.atari.st
Date: 2003-02-02 11:49:06 UTC
From: Mickael Pointier <sorry.nospam@accepted.invalid>
Message-ID: <3e3d0504$0$266$626a54ce@news.free.fr>
Source record: 29450

Hi.

I recently aquired a VME Nova graphic card, unfortunately the driver disk is incomplete and only contains TT drivers (in a DATA.TT folder). Could someone send me by email a complete zipped version of his driver disk ?

I guess that it should contain a DATA.STE (or similar name) folder containing the following files:

- emulator.bib
- emulator.prg
- menu.prg
- sta_vdi.bib
- sta_vdi.prg

thanks a lot !

Dbug (dbug@defence-force.org)

I agree but this is from a foreign site. It is really hard to tell
what is correct and what is not. I guess if you can read Dutch,
then I see your point. Hey, at least it loaded it. <g>

The documentation for my new router/adsl box is another victim
but I think I have just figured it out. I accidentally opened the
PDF manual using version 3.03 and then decided to have a look at the
printed version instead.

The problem seems to be that the character set is displaced two
letters earlier in the alphabet; so C becomes A and Z becomes X
etc. So 'Reference Manual' becomes 'Pcdcpclac L ls j'.

This seems to upset the font spacing and alignment and makes things
look much worse.

It may just be this one font that is affected this way. Another font
further down the first page is unaffected, other fonts may have different
problems.

Wolfgang, if you are reading this could you investigate the problem ?

Regards,

Peter

672. Re: CD-RW on Falcon

Hi,

>I have a Yamaha 16 10 40 for 1,5 year and noted that he read with more and
>more difficulties, then he couldn't wrote correctly : audio CDs could be
>played but list of songs seems bad written and couldn't be read by any CD
>drive. I accused the software, then the cable, but now I'm sure it comes from
>the CDdrive.

Don't jump to conclusions to soon, sometimes all what's needed it to use a
different brand and type of CD's. Yamaha advices to use CD's with a gold or
silver reflective coating. Kodak and Philips are some of the better known
brands that sell CD's with "gold" coating. And Verbatim is the only one I
found so far that makes CD's with "silver" coating.

>
>If some other would confirm the same trouble I will never more buy a Yamaha
>computer stuff.

Well, then your choices will be very limited. Yamaha and Plextor are the only
ones to choose from, all the other manufacturers have stopped making writers
with SCSI interface. Note however that the latest Plextor doesn't work (yet)
with the Anodyne software so you'll have to buy SoundPools CD Recorder Pro on
top of it as well.

The Plextor PX-W4012TS SCSI model costs a small fortune compared to the IDE
model, one must be stone cold crazy to pay more then $250 for a CD-RW these
days. The latest Yamaha CRW-F1 costs under $120, Yamaha has stopped producing
"real" SCSI burners some time ago, they include an IDE to SCSI convertor with
the "SCSI" model which allows to use the device on the TT or Falcon SCSI
interface. I've no idea if the Link can handle it.... Tip of the month: attach
a standard IDE cable to the convertor and you can add an extra IDE hard disk
to that convertor as well. This must be the deal of the century, one not only
gets a very good writer for his money, but the IDE to SCSI converter is the
icing on the cake. HD Driver sees the two IDE devices as two seperate SCSI
devices, so no problems there either. Format the IDE hard disk in FAT32 format
and enjoy....

While I'm at it:
Everyone who hasn't got a writer yet and is thinking of adding one later on,
should do it *now*. It's crystal clear that CD-RW's are on the way out, the
IDE models are sold for ridiculously low prices and the DVD writers are the
new kid in town... Just like SCSI scanners have disappeared all of a sudden,
the same thing is happening with SCSI writers. Yamaha has announced that it

ceased the production of CD-RW devices all together. Plextor is the only one left (for the time being) producing something which is still usable on this platform. Don't wait untill it's too late...

Cheers from Belgium
Dennis

675. TT and EtherNec problems

Newsgroup: comp.sys.atari.st
Date: 2003-02-02 18:43:58 UTC
From: Jean-Luc CECCOLI <wdwd@wd.com>
Message-ID: <WS3.913b349f.2afa0a82.wdwd@wd.com>
Source record: 29460

Hello,

In my attempt to attach my TT to a LAN, I made a few tests a couple
of days ago, which showed that the TT could send and receive packets
for 5 minutes with no problems after it had been powered on, then
for 3~5 minutes the number of wrong packets went increasing, and
finally after something like 9 minutes, there was no correct packets
received anymore.
I wondered which was faulty, from my TT or EtherNec, and I could
find with no doubt that it is the TT.
So, can anyone explain to me what the problem with those machines is,
and why it only happens on certain ones ?

Thanks in advance,

J.-Luc

>|Joseph D. Place |

I use Screenblaster II with Magic.The order in my Auto folder is

MAGXBOOT.PRG (modified for Afterburner FWIW)
NVDI.PRG
SBLASTER.PRG
etc.

System works fine, runs at something like 720x640 using the B port.

Hope this helps

Probably you only have a Nova card that works on a TT. As far as I can recall you need to set the jumper on the board to MSTe but in addition supposedly those GAL's (2 IC's on the adapter board) need to be replaced in order to get it working in an MSTe. I know I had to have them replaced ni order to get my card to work with a Mach64 card instead of a Mach32. But even so, I think I only have TT drivers. Sorry. Those drivers cost money too unfortunately, I don't think it's quite legal to give it out.

Hello,

My TT works absolutely fine with the EtherNEC (both of them no less) under
MagiC or MiNT. Suggestions:

A: Try Ozk's driver (http://assemsoft.atari.org)
B: Ensure you have an authentic RTL 8019 card - most ISA ne2000 cards that I
tried indeed had some strange problems or didn't work, but the RTL8019 is
what this adapter was built with. It works well! I highly doubt your TT
is to blame, more of a driver/ISA card issue probably.

Have you checked my old posts on the subject?

Take a look at:
http://groups.google.com/groups?q=STinG+EtherNEC+TT

I tested on two TT's and they behaved differently. I'm now using EterNEC
with my main TT and it works well after tweaking the running order in the
STING folder _and_ setting the modules to use TT RAM.

Try HDdriver, it is pretty potent. I am running 7.8 I think. I only trialed Magic for MACE here in Melbourne, ended up going to Mint myself.
Try this, make sure the res is the same. i.e. 640x480 256 colours. then bench the time taken to copy the files. The increased resolutions require more horsepower, if you compare say, 1024x768 to 640x480 the higher res will cause the machine to run slower.

687. Atari ST games wanted

Newsgroup: comp.sys.atari.st
Date: 2003-02-03 06:44:09 UTC
From: satcom2@attbi.com
Message-ID: <82a18ff2.0302022244.6a26dbe7@posting.google.com>
Source record: 29469

I am looking for the following *complete* games, in decent condition.
(don't have to be perfect) I will list them here along with the amount
I will be willing to pay for each.

Magic Boy $20
Paladin $15
Lethal Xcess $25
Ghost Battle $15
Vaxine $15

If you would rather trade send me your list, I have incredible amounts
of ST games, most complete, and you never know what I might let go of.

Absolutely - and it's also worth pointing out that drives with minimum writing
speeds of over 4X aren't usable on our platform, where 2 or 4X is about the
limit as I see it.

> reproduce them since they seem to be OS specific...

The errors with MiNT could well be useful anyway, since they (among other things) do reveal:

a) Where the program goes wrong
b) If the program is making a read or write error (and if so, at what address) c) If the program hits a bad instruction

In most cases, the bugs are not OS specific, but the symptoms of them are.

The error messages could perhaps lead to some rough ideas of what in the code is going wrong, and even if it can't be reproduced on the authors setup, a debug version of the program could perhaps reveal interesting things on a beta testers setup.

I just reactivated my old TDI-Modula (Vers. 3.XX) for my ST.
Some of my disks are corrupted. I miss the acc File for TDI-Modula,
which is required to set the paths for the compiler, linker, etc.

Can someone help me and send me the file ?

Thanks ....

>B: Ensure you have an authentic RTL 8019 card - most ISA ne2000 cards that I
>tried indeed had some strange problems or didn't work, but the RTL8019 is
>what this adapter was built with. It works well! I highly doubt your TT
>is to blame, more of a driver/ISA card issue probably.
Well, it works fine for about 5 minutes after power on, then there
are lost packets for the next 4 minutes, and then nothing anymore.
I wanted to be sure it wasn't the adapter and/or NIC, so I switched
the TT off for 1/2 hour, and gave it another try : it just behaved
the same way. But the only thing that points out, is that a component
either in the TT or/and NIC goes bad after a few minutes.
So, I finally unplugged the adapter, switched the TT on, and let it
run for 1 hour, then powered it off, plugged the adapter+NIC in again
and powered the TT on : I couldn't send any single packet from the
TT, so I'm then sure it's because of the TT.
Now, I need to find where the problem comes from. Not that easy...

I tried a whole bunch of free ones -they picked up Kazaa as a virus
and when i got round to using McAFee VirusScan 7 it cleaned my virus
.I have not tried f-prot but if its free then how do they keep up with
the new virii that come out -maybe advertising cost? Go with the big
names like Norton's, McAfee, Panda?

Hello Halvard,

> modicouq.tos
When double-clicking it, all I got was a list of values.

The programm can work either in AUTO or with double clicking it.
It display the values found in the cooky jar and -> the value found in
the file modicouq.d_v that will replace the previous.

I believe the "_IDT" cookie is the one I'm looking for. It's shows vith
a value of 4352.

In the modicouq.d_v are samples and _IDT is the setting for daymonthyear
(but I forgot wich s parator).
You can let or suppress all the cookies you don't wan't to change, letting
only _IDT.

I will look to find other values for it. Can you recall me wich format you
want please.

Regards

> The documentation for my new router/adsl box is another victim
> but I think I have just figured it out. I accidentally opened the
> PDF manual using version 3.03 and then decided to have a look at the
> printed version instead.

The only one solution for me is that the version 3.03 uses a new
library - FreeType. This can be the problem - the bad implementation.
But I can't tell it for sure - I don't know the code.
I'm sure it's not so hard to solve that problem and Wolfgang will
solve this in few minutes.

> The problem seems to be that the character set is displaced two
> letters earlier in the alphabet; so C becomes A and Z becomes X
> etc. So 'Reference Manual' becomes 'Pcdcpclac L ls j'.

In fact. Not all fonts displayed (used) in PDF documents start with an
"A". This can be different from one document to another - even more,
from one line to another.

> This seems to upset the font spacing and alignment and makes things
> look much worse.

Right.
Generally in PDF are different fonts (type of font etc.). And each
font can be defined in different way - there are few tables, which
discribe one font.
So if one of the table is specified in wrong way all the fonts will be
displayed in a wrong way.

I could say: RTFM ;), but I will not... It's just to big document and
a normal user dont't have to know all the details about PDF documents
:)

Regards

Rafal Kawecki

>Have you checked my old posts on the subject?
That's done, now.

>Take a look at:
>http://groups.google.com/groups?q=STinG+EtherNEC+TT
I did read all your posts and answears from 23/11/2002, the one
where you write you had to sort the modules in STinG folder...

>I tested on two TT's and they behaved differently. I'm now using EterNEC
>with my main TT and it works well after tweaking the running order in the
>STING folder _and_ setting the modules to use TT RAM.
... and that didn't help me at all!
Here are the STXs I own :
- ether.stx, which isn't even seen by the system ;
- etherne.stx, which seems to be made for working with VME ;
- enec2.stx, the one made for CT2 ;
- and enec3.stx, the one for falcons and TTs.
I tried any combination in the STinG folder, with and without
setting TT-RAM flags, it didn't change anything.
Anyhow, why would it have change anything, since I'm *_quite_*
sure it is because of my TT ?
Actually, it works fine for the first 5 minutes after power on,
then it starts beeing on the blink, losing more and more packets
for the next 4~6 minutes, and then stops working.
See my previous post, all this definitely proves that it is my TT
that is faulty. Maybe is it a special one or, rather, the guy whom
I bought it from forgot to tell me about this problem.
Now, I hope I will find what's wrong with it asap, and then I can
set my lan.

I don't think they're unfair. This is not a commerce group. None of the
x-posted groups are either. He posts too often. It's "ok" just because
the groups he posts in don't get much traffic anyway? I don't happen
to think so. He then goes on with no apology when confronted about such
tactics with bizarro stories about things I could give a whit about and
how people should take pity on him and patronize him? It's just not
professional.

>Got a couple of hard to find items and yes, his service is excellent!

>use insured mail when sending money.

Who on earth would send hard currency thru the mail?! That's not a good
idea for eBay. Much less an "Internet Business". Hell, it's not even a
smart idea for people who know each other.

�I want to display the date as: day-month-year (today, being 04-02-03)

So you only need to run the programm as the format you're looking for the value
in modicouq.d_v
Then, if you use a tos programm and ask for date (I.E. command.tos) you should
get the format you're looking for.
Most of the time ACC, CPX, and other programms extract the date and reorder
it the way they want ...

> Still, I'm not used to this way, and would prefer the "day-month-year
> format" (today being "01-02-03". Wow!!! that's a pretty cool date!!!).

There's been quite a few 'cool' dates during 2002, and now some more will pop up in 2003, if you live 998 years you'll get to see 03-02-01. 8~)

1 minute past AM on new years day 2001 was one such event, 01:01 01:01:01, in 2002 02:02 02:02:02, and the 3rd of march this year you'll get 03:03 03:03:03 at 3 minutes past 3 on the 3rd of march.

Another loads of boring ball's brought to you by... The Welshgit.

> There's no NVRAM on a Mega STe :-(

Begin clip from The Atari Compendium(c)

NVMaccess() accesses the non-volatile RAM present in the TT, Mega STe, and
Falcon030. You should not read or write to this area as all of its locations
are currently reserved.

End of clip from The Atari Compendium(c)

If there were a lot of Atari dealers posting ads like Ben does things
would be very different... However, as he is actually one of very few
left his posts simply are no problem. They do not add to the bandwith and
there is no charter for comp.sys.atari.st that prohibits adverts (I don't
know about the other groups this goes to).

>tactics with bizarro stories about things I could give a whit about and
>how people should take pity on him and patronize him? It's just not

Professional or not is not an issue. There are lots of other posts here
that are not professional at all. But, in a sence you are right. If i
were Ben i would not post the very same text several times. Instead I
would post short messages whenever I had something new to tell, like
"New catalogue out" or "several TT graphics cards in stock" with a link
to his website.

What are you talking about?? Why would that be insecure??

I have actually sent huge amounts of money abroad in exactly the same way in my job some years ago. SEK 200000 ($25000) in each parcel and a couple of these parcels a day using nothing but the standard post office services and local armoured transports. Later on the Post only allowed max SEK 50000 in each parcel so we now use other ways to get the bank notes to there destinations.

To just send a minor amount of bank notes only costs appr. $6 here and everything is insured all the way until Ben himself has the envelope in his own hands.

I think we all can agree to that Ben Smith can be trusted 100% and not simply keep the money without delivering the goods! So, this is simply a 99.9999...% secure way of sending money to any country. And all perfectly legal of course...

>pop up in 2003, if you live 998 years you'll get to see 03-02-01. 8~)

>Another loads of boring ball's brought to you by... The Welshgit.

If you happen to have to write the date by hand several times a day it's
another story... Yesterday was quite hard (030204) and I'm really looking
forward to Nov. 11th 2011 (111111). And yes, it's a Friday (thanks to
CLOCK.CPX)...

To the main question: I don't think any cockie in the world will make
Swedish TOS 2.nn or 3.nn change the way files are dated in the desktop.
The solution is to use an alternative desktop application.

seems to have changed, the monitor flickers subtly and it is driving me nuts

How do I fix this?

Thanks

713. Best ST emulator for gaming?

Newsgroup: comp.sys.atari.st
Date: 2003-02-06 01:36:32 UTC
From: Paul Nurminen <visit_my_site@nurmix.com>
Message-ID: <8rd34vkoubni87oqtg83th59h2i9e1ugb3@4ax.com>
Source record: 29494

While I do have a Falcon, which I use extensively in my studio for music production, and an STE - which is currently not being used, I would like to run an ST emulator on my PC in order to play some older ST games. The main two reasons being that the Falcon can be problematic with ST games, and my STE doesn't currently have a hard drive attached.

I've used STeem for a handful of things - most noteably with the old ST database program called SUPER CARD. However, it doesn't seem terribly reliable with game software. I have seen a few other ST emulators out there, but am not sure which one is best for ST gaming.

Any suggestions would be appreciated, and if anyone has successfully used an ST emulator on a PC to play "Ultima 5" and "Ultima 6" in particular, I'd love to hear about it.

Thanks.

The STE is TOS 1.6 or 1.62 (cures the restart in medium resolution bug) so
all have to do is format the disks in the STE and then...
Having said that I find for the best results format in the pc then the ST's
should both have no problems.

Pardon any delay in service as my friend died. I'm just now catching up.
I've updated 6 of my 8 Catalogs, all 8 Bit and ST. Adding many new items!
Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari
Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods!
So not only do I sell NEW Atari Goods at a competitive price, I also sell
used Atari Goods you may not be able to find anymore at Swap Meets, Thrift
Stores or even Auctions Sites! And I sell for less! And unlike those who
will remain anonymous! I test Goods before I sell them. I can afford to
sell for less because I keep overhead down, I avoid going into debt and I
avoid making promises I can't keep! This includes not offering services
that I cant follow up with! So not only can I sell you some Great New
stuff! But I can sell you hard to find 2nd Hand Goods, partly because
I'm the guy most people come to when they want to give their Ataris a New/
Good Home! So I'm involved in saving Orphaned Atari's from Atari Heaven!
Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org
Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974!

>- and enec3.stx, the one for falcons and TTs.

Where is ENEC.STX?

The two drivers to test with a TT are ENEC3.STX and ENEC.STX

>I tried any combination in the STinG folder, with and without
>setting TT-RAM flags, it didn't change anything.
>Anyhow, why would it have change anything, since I'm *_quite_*
>sure it is because of my TT ?

Of course your TT may have some problems... But, all I know is that the two TT's I tested on behaves differently. A working setup on one would not work on the other.

On this TT I'm using now I can't use the EtherNEC with single TOS or Geneva. It only works with Magic loaded. As was discussed in the old threads there must be some sort of timing problem that appears when used with the TT.

>Actually, it works fine for the first 5 minutes after power on,
>then it starts beeing on the blink, losing more and more packets
>for the next 4~6 minutes, and then stops working.
>See my previous post, all this definitely proves that it is my TT
>that is faulty. Maybe is it a special one or, rather, the guy whom

It could simply be that the timing for your TT is just slightly off. When it warms up this proposed "timing window" will move around.

I have a third TT here that shows similar behaviour even without anything in the cartridge port. If I boot with Magic it will run for 5 minutes or so and then Magic freezes. If cooled down for an hour it will un 5 minutes again. It does however run perfect without Magic, but GFA Basic editor, Calamus, Cubase will not work. Very strange!

All this is with 4 MB ST RAM and an original Atari 4 MB TT RAM card. If I take out the TT RAM card it runs stable with Magic and everything else.

In fact this is how I use it to run the Weblight webserver under Magic on
a 24/7 basis.

Maybe you could take the TT RAM out and test the EtherNEC.

Also keep in mind that giving it a shot in your MSTe probably wouldn't hurt the card. If the drivers are free, you can set the jumper on mste and see what happens. The GAL's definately need to be replaced if upgrading from Mach32 to Mach64.

Which jumpers are you talking about ?
What are exactly these "GAL"s that should be replaced ? Is it on the MSTE
board, on the VME adapter, or on the ET4000 card ?

DV>reproduce them since they seem to be OS specific...

There's some misunderstanding, I mean the alert from NewAlert under MiNT,
which shows the adress of the buserror and the adress of the programm and
also the adress referenced to. So it's easy to figure out, where the error
in the programm is.

Johann

Hi Joakim,

>The errors with MiNT could well be useful anyway, since they (among
>other things) do reveal:

That's right, especially since NewAlert gives the complete information
about the adress of the error, the adress the programm reads/writes and
the startadress of the textsegment. With this its easy to find the
location of the error in the programm.

Johann

725. Wanted Atari Falcon Please...

Source record: 29407

Hi,
I'm looking for a Falcon with 14MB (more or less a stock Atari
falcon)
I don't really want anything that has been moded or
overclocked/accelerators but I guess if the price or trade is right
I'll consider it.
I prefer the cosmetic condition to be near excellent and obviously
for the sucker to work ;)
My last Falcon was accelerated and ran kinda wicked with the
games/software I was using and I didn't care for it.
I would also prefer that it have (I guess MiNT? Or MagiC?) I'm not
sure which one it is... but that's not nesc. as I guess I could always
get it later.
H.D. also a must.
U.S. Only please... also looking for more of the following:
1040ST
Mega ST 2 or 4
Atari Touch Tablet
Please feel free to e-mail me at:
adistortions@aol.com
Thanks,
Clint Thompson

Hi Jens,

>I just reactivated my old TDI-Modula (Vers. 3.XX) for my ST.
>Some of my disks are corrupted. I miss the acc File for TDI-Modula,
>which is required to set the paths for the compiler, linker, etc.
>
>Can someone help me and send me the file ?

Just in case no one is able to help you out....
ASH Megamax Modula has been declared freeware some time ago and is currently
at version 2.3. The link from where I've downloaded it is dead, but I can
mail it over if you like... the packed archive is 4.2 Mb in size.

If anyone else here wants it, just yell, the package is completely in German
and given it's size, very unlikely to ever be translated...

Cheers from Belgium
Dennis

From: Mark Duckworth <mduckworth@spaamnot.atari-source.com>
Date: Sun, 02 Feb 2003 15:57:53 -0500

Hi Mark,

Once again you manage to instead of helping someone out, confuse him with
spreading a lot of bull....

>Probably you only have a Nova card that works on a TT.

There is no such thing...
All the original NOVA VME cards work in both the TT and MegaSTE.

>As far as I can recall you need to set the jumper on the board to MSTe

Do NOT TOUCH the jumpers on that VME interface !!!
The jumper only needs to be set when an ET4000 graphic card is used, when
using an ATI card one should leave the jumper settings alone. Since only the
first batch of VME cards came with a ET4000 card (1993), it's very unlikely
that Mickael has one of these.

>but in addition supposedly those GAL's (2 IC's on the adapter board) need to
>be replaced in order to get it working in an MSTe.

The GAL's *DO NOT* need to be replaced. The GAL's only need to be replaced
when a graphic card is used other then the one which was originally supplied
with the VME board.

>I think I only have TT drivers. Sorry. Those drivers cost money
>too unfortunately, I don't think it's quite legal to give it out.

All the NOVA VME graphic card installation disks are supplied with drivers
for the TT *and* MegaSTE....
BTW: the drivers are free and so are the updates, they've always been free.
There's a difference however between the installation disk and drivers. The
programs on the installation disk are commercial.

People who have an original Nova card and lost their installation disk should
not despair, although ComputerInsel doesn't exist anymore, support for the
Nova products still exists.
Get in touch with Gerdhard Huber (the author) quote the serial number of the
card and he'll mail you the latest installation disk. (version 2.67)
mailto:gerhard.huber@pl32.de

The same applies for Photoline and the Nova scan drivers....

Cheers from Belgium
Dennis

On 4 Feb 2003 20:28:00 +, Peter Schneider wrote:
>M>the 'syndrom of aged light'.
>once I was tols that Yamaha writers tend to survive warranty time only.
But my 8424 SCSI will be three years old this month.

You're lucky, but yours came probably from a different factory line.

Well I was about to satellize my Yamaha 16.10.40 through the window last
week but after studying ALL from tracks to resistance, laser diode, etc
I found the failure in the manufacturing process.
I cured my CDwriter that works now very well again.

People that have the same trouble and are not afraid to open it, then
contact me and you will understand that Yamaha are not that bad after all.

I could write it here, but 3 pages writings on a forum could be boring
for those that are not concerned.

Note : a CDwriter become bad if you use Extendos and can't see the tracks
on an audio CD.

>
>Absolutely - and it's also worth pointing out that drives with minimum writing
>speeds of over 4X aren't usable on our platform, where 2 or 4X is about the
>limit as I see it.

Yes, but "our platform" is more then just the original hardware, the Hades and
Milan are just two examples... On a Milan with SCSI card speeds up to 40X are
feasible, on a standard Hades I suppose 16X is the limit... and under MagiCMac
and MagiCPC one can burn CD's at the writer its maximum speed.

Cheers from Belgium

734. Need help setting up Floptical w/the original Link

Newsgroup: comp.sys.atari.st
Date: 2003-02-07 18:39:36 UTC
From: Rob Aries <r.aries@rcn.com>
Message-ID: <BA696797.90E4%r.aries@rcn.com>
Source record: 29416

I recently took my ST out of mothballs after 7 years. I used to use it with a floptical drive and ICD Link. The drive died, so I got another one from Ebay, but it doesn't work. I'm hoping it's a jumper issue.

I found this on the web, it details the jumper functions:

****

I325VM POWER CONNECTION AND JUMPER OPTIONS

Looking toward the rear of the drive:
Cover of drive on top: Ground is circle (o)

2MM shunt Jumper
* * o o o o o
* * * * * * * <- Jumpers
E7 E6 E5 E4 E3 E2 E1

[sorry if these don't line up exactly, you get the idea!]

E1 Drive Select 1
E2 Drive Select 2
E3 Drive Select 3
E4 Enable SCSI Parity Checking
E5 Enable Unit Attention after SCSI Reset

E6 & E7 Terminator Power Options E6 E7
No Power Open Open
SCSI Power Open Short
Drive Power Short Open
Drive & SCSI Short Short

****

I can figure out E1 to E3, that's obviously for selecting the id #. I'm not sure how to set the parity, terminator power, or the "Enable Unit Attention after SCSI Reset" though.

Right now this is what happens: when I turn on the drive the busy light stays on. When I turn on the ST it goes off. The drive is not seen at all by the ST (I tried HDDRIVER, scanned the bus, etc.). I've tried a few different combinations of jumper settings with no luck. The Link & cable is OK because I've used them with a SCSI hard drive.

What makes me think the floptical mechanism is OK is that, when I insert a disk, I can hear the head seeking to the boot sector normally. However, it might be that the drive is not good because it was an "as is" auction with no guarantee. If I knew the exact way to set these jumpers, it would save

me some time trying to figure out if the drive itself is bad or not.
Thanks!!

Rob Aries

735. Octopus BBS News

Newsgroup: comp.sys.atari.st
Date: 2003-02-07 20:33:29 UTC
From: Mark D <mducksub@removesspam_atari-source.com>
Message-ID: <1044656957.734981@blade.atari-source.com>
Source record: 29417

Hello folks,

For those who follow, I am the new maintainer of the feature-packed BBS software, Octopus BBS. Currently the latest Internet version has been released but I have found and repaired several bugs I have found and prepare to release a new version. The new version will feature these bug fixes and in addition have new features such as embedded newsgroup support for local message areas among other things. The Atari-source BBS is well under development and will reopen soon featuring a custom look and feel and functionality.

lszrz is under rewrite to allow a solution for file transfer under internet mode.

Important notes for users:

If you've had troubles, please note that attempting to use Octopus under MiNT or Magxnet will not work unless you have the more recent gluestik. You can download the dated 0.13 from the freemint page but you should be using ~0.30 or so from the freemint cvs.

I have made several steps and written some comprehensive documentation on rationale behind the internet side of things for Octopus as well as some new features. I plan to expand the MAF messages and file service to allow for pulling and posting of news messages to usenet through use of the news downloader, newswatch.

For those who do not know what Octopus BBS is or might be scared of the name, Octopus BBS is the now FREEWARE premeire Atari ST BBS suite. Runs on Atari's with 1 meg of RAM or more and now has full Internet support through sting or mintnet/magxnet with gluestik.

Here is a basic feature list:
TOS/GEM mode - tos mode is compatible with mint vconsoles - under development is a daemon mode which will allow it to run similarly to other daemons under MiNT.
Somewhat working multinode support - under development to make it work much better and to make your open nodes virtually limitless.
Under GEM mode - full, fast, efficient local 16 color terminal emulation.
Full semper/fidonet message system integration.
Internal QWK mailer support
Comprehensive file and message bases
Support for many terminal emulations and languages.
Fully scripted interface allowing for a wealth of different looks and feels

Remember, Octopus BBS is perhaps the only ST BBS suite left under active development and is open to ANY feature request! If anyone would like setup

help or needs binaries of later MiNT kernels, or utilities like gluestik, simply ask and I will help. The goal is not to profit but simply to create an international Atari BBS scene free of long distance calling charges! A scene accessible by any internet user anywhere on any kind of computer through the universal telnet protocol and a wealth of terminal emulations.

Also remember, Octopus BBS's main page is http://atari-source.com, you may look there for future news and announcements as well as important information. The Octopus BBS project page link is located on the upper left hand side in the main menu.

So to close. stay tuned for an imminent bugfix release followed by a new features release.

Thanks!
Mark (piku on #atariscne on IRCnet),
http://atari-source.com

Hi Rob,

This is off of memory, but I'm sure others will correct me if I make a
mistake. :-)
E4 (Enable SCSI Parity Checking) should be OFF. As far as I know, the
Atari does not use parity checking.

E5 (Enable Unit Attention...) should be ON. Otherwise, the unit will not come up automatically on start or reboot. Instead it will just sit idle until you specifically tell it to start.
E6 & E7 (terminator power) should probably be OFF. Since the ICD Link does not provide termination power, telling the drive to expect it seems futile to me. I'm not entirely sure of this one, however, since the purpose of these lines might be to SUPPLY termination power further down the line. What I do know for sure is that my Atari systems have no termination power.

Galen

Dennis,

I did a quick search for CRW-F1 and didn't come up with any hits under
$230. Do you know where I might find the CDRW at the price you

Well... the archive I was working for happened to be corrupted,
resulting in some files not being retrieved :-(
I could find a safe one in an older backup (thanks to Gemar and
my 4mm DDS!), and after I extracted the correct file and put it
last in the STinG folder, I pinged the PC from the TT and was
very happy to see they were not a single packet lost half an hour
after!

>> [...]

So, now I (thanks to you) have ethernet working on my TT, I'll
try and make it share peripherals with the PC.
Any suggestion on how to do so under MagiC ?

Thanks again,

J.-Luc

746. Falcon Clock buffer modification

Newsgroup: comp.sys.atari.st
Date: 2003-02-08 22:37:46 UTC
From: <>
Message-ID: <_Ef1a.42$Fd4.5518544@newssvr15.news.prodigy.com>
Source record: 29428

Can anyone send me a schematic (or a link for one) for a -correct- clock buffer modification using a 74F08 chip? I have found two different schematics on the web. Both were different. One was similar to mine, the other totally different. I'm afraid that mine was not done correctly, as I am experiencing the kind of problems descibed in the HD Driver manual, quote: "(Falcons) are especially prone to disk errors when transferring large amounts of data in high screen resolutions (via ScreenBlaster or BlowUP, for example)." It goes on to say that a dealer may modify the Falcon to keep this from occurring. From what I can gather, this is the clock buffer modification?

If one drawing that I found was correct, I can jumper two pins on the chip and mine will be complete, but I don't want to ruin my beloved Falcon, so any advise from experience will be very helpful.

These are the problems I'm having:

With ICD Pro: Slow disk writes and deletes when using Screenblaster. Cubase Audio works fine.

With HD Driver 8.1: System hangs on large disk writes and deletes. Cubase Audio will not start (multiple bombs).

Thanks!

Galen,
Goto http://www.pricewatch.com I have found many CD-
RW drives here for under 100 dollars. Matter of fact
this is where I got my Sony 10X4X32X Cd-burner for 80
dollars. And yes it is a 50 pin SCSI burner.

Thanks
Carey Christenson

Anyone,
Does anyone know of a program that will allow me to
help my friend increase his screen resolution??
Currently he is at the MAX. on his Falcon which is
640x480x8 bit and he does not wish to purchase the
Eclipse with the ATI Graphic Card just yet. So I was
hoping that there was a software solution for what he
needs.

Thanks in advance,
Carey Christenson

Well, most posts are definately not "professional". Then again, most
flamewars are not made in the name of business. So it's not quite the
same :) Your idea is certainly preferable to the current MO. A 2 line
post with a descriptor and URL is far better than 250 lines of the same
junk once or more a week.

This is a regional issue. Here in the U.S., you'd have to be daft to
blindly send cash money around, uninsured, in just the "general post".
The sender or recipient are not the problem, the USPS employees are.

751. SPP 4.0 trouble

Newsgroup: comp.sys.atari.st
Date: 2003-02-09 09:40:29 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0302091028390.115-100000@easymint>
Source record: 29433

I'm a frequent user of Score Perfect Pro and own version 3.2 as well as the semi-official version 4.0.

Most of the time I use 3.2 because it's more stable on my system. But today I was working on a score that needed some of the capabilities that only 4.0 offers (like unlimited polyphony). So I gave it another try and the job was done OK.

The problem I'm having frequently with SPP 4.0 is that my system hangs the moment my fileselector is on screen and I try to save a file. A reboot is all that helps. Sometimes I also have to delete the SPP.INF file to get things working again. On the other hand, the AUTOSAVE function prevented that all of my hard work was gone during those crashes.

Any SPP 4.0 users here having similar problems ?

Martin Tarenskeen
Falcon030/CT2b

P.S. Of course we're talking about the ATARI version here :-)

Galen,

I managed to get my ST to recognize the floptical by shorting both E6 and E7.

> This is off of memory, but I'm sure others will correct me if I make a
> mistake. :-)
> E4 (Enable SCSI Parity Checking) should be OFF. As far as I know, the
> Atari does not use parity checking.

Interesting, I have it ON (jumper connected). I wonder if it matters. I remember hearing something about the Link II dealing with parity in a way that the original Link couldn't. I'm still not sure about any of this but like I said, the drive seems to work and I can mount the few floptical disks I have.

> E5 (Enable Unit Attention...) should be ON. Otherwise, the unit will
> not come up automatically on start or reboot. Instead it will just
> sit idle until you specifically tell it to start.

Well this gets more interesting...E5 is OFF. Unfortunately I don't have a floptical with driver software on it to test if my ST will boot from it or not. I run ICDBOOT from a floppy and the drive mounts.

> E6 & E7 (terminator power) should probably be OFF. Since the ICD Link
> does not provide termination power, telling the drive to expect it
> seems futile to me. I'm not entirely sure of this one, however, since
> the purpose of these lines might be to SUPPLY termination power
> further down the line. What I do know for sure is that my Atari
> systems have no termination power.

As I said at the top, both E6 & E7 had to be ON for things to work! It seems that the Link gets its power from having these jumpers shorted. When either one was off, the Link was completely dead...i.e., when I ran ICD Utilities from a floppy, it saw no host adapter at all.

I have some new problems now...the only reason I wanted to get this floptical drive going is to access what's on a few floptical disks I have. They had the most current versions of software I was writing, and I wanted to check them out mostly for nostalgic reasons (no backups of course :-(. The disks are completely corrupted and unreadable. I used to do some messing around with boot sectors, FATs and directories, so I'm going to give this a try and see what I can do but it doesn't look too good. Do you know of any disk utilities that are good for recovering files? I have something called "Diamond Edge", and also there is an ICD program called "SCSI" that lets you view & edit disks at the sector level. Thanks!

Rob Aries

> Does anyone know of a program that will allow me to
>help my friend increase his screen resolution??

There's a hack on the 'net somewhere that consists of soldering a new
oscillator chip in, it looks quite easy to do and is a better solution than
using a software (Videlity etc) solution alone. It seems to work the same way
as a Screenblaster, ie gives you a faster pixel clock.

Higher resolutions gives more flickering/slower speed operation/more
likelihood of SCSI transfer problems, the latter is fixable.

Cheers

Derryck

>Any suggestion on how to do so under MagiC ?

MagxNet from Vassilis' home page will allow you to share drives on your PC,
it's also possible to print to a PC-connected printer via a print-to-disk
file IIRC. Vassilis was meant to be working on integrating all this into his
BNet package, but he doesn't seem to be around any more :-(

Cheers

Derryck

759. Logic file transfer

Newsgroup: comp.sys.atari.st
Date: 2003-02-10 10:34:45 UTC
From: claytone@foxinternet.com
Message-ID: <9fL1a.1602$Rv1.7952@bcandid.telisphere.com>
Source record: 29439

Hi all-

I was wondering if anyone has figured a way to transfer audio files created with Atari Logic Audio (vs. 2.01) to PC Logic Audio (vs. 4.8.1) ? The PC wants WAV or AIFF files, but the Atari makes "stereo" files as 2 seperate mono files that are linked together within Atari Logic. PC Logic doesn't recognize that format. I've looked at 5-2-5, but haven't figured if it's possible.

I have figured how to just play them back on the Atari, and transfer to PC via a S/PDIF connection, but I was wondering if it was possible to do it via a straight file transfer. The PC Logic will recognize the other parts of Atari Logic - just not the audio files.

Thanks,

-Clayton Murray

Hello stupid boy... mhh... sorry, very stupid boy !

I think you are not an atari fan...
do you like atari ?
no.. you don't respecte the guys who make something for atari memory, you
don't like atari

i'm making a full oldschool megademo (with flash)
i think many people will be happy with it...

Hello, Joseph, you said you were using HD driver 8. I read somewhere
that version 8 is not good to use with cubase, and the one to use is
version 7.93. Its because of the way V.8 handles SCSI. Also if you
visit Claes Holmerup's web page, he has several plans for the mods to
the clock buffer (i think). I got mine done at Wizztronics, and it
seems pretty solid. Maybe they could tell you which one they like to
do? Do you need bigger screen resolutions for your midi score
arrangements? You could run Cubase without the audio part (by holding
down both shift keys when booting up cubase) and maybe that wouldn't
be affected by the screen res. Then when working with audio just use
the regular resolution. (If cubase works well I wouldn't mess with it
too much :>)

Well it looks like FAST CLub has finally hit the dust..... I jsut checked their pages and no show. I know they haven't been answering email for quite a while but it still a shame their pages have gone.

They were a stalwart of the Atari scene in the UK and produced many fine programs, Imagecopy for one.

ahh well they will be missed!!

Message-ID: <3e47f40c.0@entanet>
Source record: 29359

Hi all,

I have a Handspring Prism PDA. Does anyone else use one on their Atari ?
I am trying use the Mint package Pilot-Link to exchange data with the Milan.

I have an old ST version that works fine but comms at 19k baud and only
writes 8+3 filenames, so it is slow and some of the downloaded files are
overwritten.

I also have the full version of Pilot-link but it is proving a bit difficult
to get it working. With HS-Modem and STiNG disabled and using the Mint serial
modem drivers, Pilot-link will now bind to /dev/modem1 but will not talk to
the Palm.

I have tried entering /dev/modem1 and /dev/modem2 and plugging the cradle into
different serial ports but it will not comm.

Does anyone know the trick to getting the Milan serial ports working with
Pilot-Link ?

Regards,

Peter

That's correct. Terminator power jumpers when on provide termpower
to devices that need it, such as the Link and active terminators.

> I used to do some

>lets you view & edit disks at the sector level. Thanks!

You might like to try KnifeST, which works fine with floppies and
hard disks that don't have too large sectors. It has facilities
for reading individual sectors.clusters, and for rebuilding a file
that has been deleted or corrupted . It also has undelete and
structure test options.

Not sure where you can get it - it was commercial from HiSoft but
did appear on a cover disk - ST Format #42B, dated 1/93.

Regards, /Peter/

Hello Carey,

I do not think there is a software solution. If there was, I doubt
it would do a very good job, when compared to a graphics card.

Well, this of course isn't as good as a graphics card, but Videlity or Videl Inside would both increase graphics resolution. I would actually highly recommend it until a graphics card is installed. You can push the resolution just a little higher, or use an interlaced mode (if the flickering doesn't become unbearable) for a really high-res mode. However, the more you push the limits, more flicker you'll get and the more you'll need a SCSI buffer upgrade.

However, if this person has a Nemesis or other accelerator that can increase Videl's clock rate, one could be very happy with the resolutions you can get with these programs. With my Nemesis, I am now running a 1120x848 mode. It's interlaced, but at such a high resolution, I can't really see much flickering except when single-pixel height horizontal lines are right next to each other, separated by a single pixel. And even at that, it's not too bad. My monitor's display specs may have something to do with that, too. At any rate, I am running a very nice big desktop. I can't stand to go back to 640x480 anymore. 800x608 is about my tolerance limit these days, especially with web browsing, where most places design their pages with 800x600 or higher resolutions in mind.

From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <BA6D73E7.2A1CB%nameerf@flash.net>
Source record: 29355

Hello!

I've seen posts on this before (but can't seem to track them down now), but has anyone had success with printing in Nemesis High mode (50MHz) using Magic/NVDI?

I've read something about using a Spooler, but the ones I've found don't help at all (unless I'm using them incorrectly).

I've also read that switching Cache modes using NEMESIS.CPX works, too. However, when I turn the Caches off, I get a significant slow-down in performance. And switching back and forth when printing is an annoying pain.

Otherwise, all I can do is switch to Nemesis Low, which messes up my high-res graphics modes I've set up. Any suggestions? Thanks!

Respect atari by buying one and coding the demo on it ;)
Atari isn't dead nor does it need to be remembered ;)
But just as well. What kind of environment do you need the picture to be
in. And as well how large (what rez) should the picture be.

Hello,

I am unsure if these ngs are the right place to ask, but here goes. (If not, can you point me to where I should ask?)

I have a version of Trip-a-Tron by Jeff Minter, but I do not have the manual. I was wondering if anybody has the manual on their PC, and could send it to me, or maybe they can point me in the right direction. Also, does anyone know Jeff Minter's email address?

Thank you very much,

Peter

Thanks for the information, I'll check it out. And no worries about
MIDI support in the emulator, since I only want to play a few games;
and I've got my Falcon in my studio for MIDI anyway.

Videlity by itself gives roughly 800x600 at 53Hz, which is a bit hard
on my eyes, though some people don't mind it at all.

I've also read a bit about people using still higher resolutions (with
lower refresh rates) on LCD monitors. Apparently, they don't flicker
as much. I'd love to hear from those with LCD monitors on how low you
can push the refresh before it gets irritating.

I'm afraid I can't help you with the schematic personally, but if you
have some general questions, you should visit the ATY Computer web
site (a computer store in Oakland, California, USA), and send an
e-mail to the owner, Alex. He's done many clock/buffer mods, as well
as just about any other mod or repair you can think of for the
ST/Falcon.

My Falcon had the buffer/clock mod done many years ago by a defunct
Atari dealer called "Alternative Computing". But as far as Alex goes,
he did install my Nemesis, so I can tell you his work is top notch.

Here's the link:
http://www.infinex.com/~atycom/

>With ICD Pro: Slow disk writes and deletes when using Screenblaster.
>Cubase Audio works fine.
>With HD Driver 8.1: System hangs on large disk writes and deletes. Cubase
>Audio will not start (multiple bombs).

I've had my share of trouble with Cubase Audio and the various hard
disk drivers too!

HD Driver (version 7.61) will flat out not work with Cubase Audio on
my Falcon. Any attempt to record audio results in multiple bombs. I
also had trouble with ICD Pro. The crashes were less frequent, but it
didn't get along well with Videlity when running extended resolutions
with Cubase Audio.

I finally got everything working well by using the bare bones Atari
hard disk driver. I can run extended resolutions with Videlity, and
the system is very stable.

My normal driver (when I'm not using Cubase Audio) is HD Driver. But
when I want to run Cubase Audio, I use a floppy boot disk with the
Atari driver, and boot from that.

I hope that helps a bit.

Mike,

I regularly run my Falcon with Nemesis on HIGH, and have not
experienced printing difficulties. My printer is an Epson Stylus 660,
and I can print using NVDI 4 / MagiC 5, or just plain text in TOS.

What exactly occurs when you try to print?

783. Atari 520 STE / Ultima / Monitor Woes!

Newsgroup: comp.sys.atari.st
Date: 2003-02-11 03:55:06 UTC
From: Paul Nurminen <visit_my_site@nurmix.com>
Message-ID: <3drg4vo7t3ingn0m972rs02s0s1mdsten1@4ax.com>
Source record: 29364

Well, it figures...

I pull my 4meg 520STE out of the closet to set it up again (for some "Ultima" gaming), and there's some good news, and some bad news.

A little history: Many years ago, I played Ultima I on a friend's Apple II Plus. Then later, Ultima II and III on my 800XL. And a few years after that, I played Ultima IV on a Nintendo NES. I've owned Ultima V and VI for my ST for years, but never got around to playing them. But recently, I found "The Ultima Collection" for my PC, which has all the games up through Ultima VIII. It got me "in the spirit" to play again.

But when I tried the PC version of Ultima V, I quickly realized that it has no music, and only minimal sound! The ST version is much better, with a full soundtrack (and to me, the music and sound is a big part of the Ultima experience). Well, Ultima V seems a bit unstable on my Falcon, and playing 'emulated ST Ultima' on my PC with STEEM didn't quite cut it either (the sound isn't really right, and there are some graphical glitches as well). Hence the need to break out the old STE.

Well, I hooked it up last night, and realized the power supply was cutting off intermitently. Upon inspection, I noticed one of the capacitors was a bit loose. No big deal. A re-solder this morning took care of that.
:-)

Then, I finally got around to setting up a 2 gig bare SCSI drive I bought on eBay last year. I installed it in an external case, formatted and partitioned it (using my Falcon, since I'm still working out a deal to get a LINK so I can connect the HDD to my STE). All was well there too. The drive had no bad sectors, and works well.
;-)

So then, I run some gmaes and demos (from floppy) on the STE, and my SC 1435 color monitor, and everything looks and sounds great. I'm happy, and take a lunch break, with the STE running a demo just to test things out a bit more.

I come back half an hour later, and my SC 1435 monitor has gone dead! No display, no power LED glowing. The only sign of life is a low, but audible whistle coming from inside. It was getting power, but either the tube finally went, or perhaps something with the monitor power supply died.
Man!

:-(

So, I guess I need to find a new color monitor now! All this just to play a 15 year old RPG!

Oh well...
;-)

>Mark
>

Thanks for the info. I was mainly wanting to be able to use HD Driver, as
it provides the SCSI routines for my Scanner and some other features that
I like. I don't need higher resolutions for Cubase, but they are really
nice for publishing and web-browsing. I agree with you that since
Cubase is working well, I don't want to mess with it much. I just spent
the better part of a day getting everything working properly after all my
experimentation. I was just wondering if the proper clock modification
would be the solution so I could use HD Driver, Screen Blaster, and Cubase
(not necessarily together).

From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3E48AD29.7F851CD@siemens.at>
Source record: 29367

Hi,

I'm using NVDI 5.03 to be able to use TrueType fonts in the pictures
I create with PixArt. The fonts come from various sources incuding
some Atari CDs and an Epson driver CD. So there are thousands of
files named mostly with numbers that tell nothing about the contents.

What obviously is needed here is a utility which can load a font file,
display the font and in addition enable me to delete or eventually
rename or move the font file for later use.

Does anybody know about such a utility or if not maybe a description
of the truetype format so I could code it myself ?
BTW, if I have to code it myself I would like to hear from anybody
who is interested in such a utility and what features they think
necessary.

bye
Gerhard

Let NVDI's Fontname utility handle all your fonts. It will create named
folders for them and will greatly ease working with many fonts.

The best answer is to use a different printer device handler, iPRN (magiC
version). There's a demo version in the NVDI "Extras" folder. Someone will be
able to tell you if the full version is still available, as the UK shareware
house closed down a long time ago (CyberSTrider).

I've used GEMspooler in the past with good results also.

Cheers

Pacifist hasn't been updated for, um, aeons. Actually his author has
disappeared for some years now, which is a pity...
The latest version of STeem runs everything I throw at it; some games that
initially didn't work can now run fine through the use of patches (they
come with the binaries), and really, there's only a handful of them that
won't run still... And I've tried about every game that's on a menu disk :)

I thought I would update anyone interested in trying GNU/Linux on their Atari.
Obviously not everyone here reads comp.os.linux.m68k

I managed to get the official Debian m68k installation CDs from a former Atarian
in GB. Just the first 3 CDs are needed apparently.

Unfortunately the installation doesn't get very far on the Milan060. It seems
that the binary has been ported to the Atari and to other machines with 68060
but not the 060 Atari's.

Couple of Linux m68k guys e-mailed me with questions and I hope they can come-
up with a solution.

I wonder if the installation would work with the 68040 Milan ?

They surely will be missed.
Although Imagecopy can't cope quite well with a modern OS such as
freeMiNT/N_AES I use Imagecopy almost daily.
I hope the author will release the sources someday or make a new version.

Kind regards,
Martin

Peter,

Thanks for the tip, I did find KnifeST, haven't run it yet though.

I seem to remember having a program that let you go through a disk
sector by sector, and build a new file from what you found. Maybe
KnifeST was it.

Anyways I found a different program from ICD called "Cleanup" that
claimed to repair directory structures. I let it do its thing but it
didn't help...just created a few hundred files called "?UNKNOWN.xxx"
that were all 2048 bytes long. It may have done some writing to the
FATs which would be unfortunate. I hope at least one of the FATs is
still OK in which case I have a small chance of recovering some files.

800. TT keyboard mylar repair

Newsgroup: comp.sys.atari.st
Date: 2003-02-11 23:01:23 UTC
From: captainvimes@myrealbox.com
Message-ID: <8qvi4vscug58n7l0e6pda4o94agffc172a@4ax.com>
Source record: 29381
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The following keyboard repair info was originated by Mario Becroft, but has since disappeared from the net. With Mario's permission, I'm posting it for posterity :-). The usual disclaimers apply.

========== snip ==========

This is a copy of Mario Becroft's instructions for Keyboard Repair of the Atari TT mylar, 1997.

These instructions may also apply to other Atari computers: no guarantees or warranties are claimed: following these intructions does not guarantee anything: all who follow them do so at their own responsibility, with no recourse to Mario Becroft or his copyists.

The following was downloaded from the site of Funkeyware.org and printed out for safe-keeping: just as well, as my TT needed repair, which I carried out successfully. It is now typed out by Charles Stanley, cstanley@zetnet.co.uk, since all online copies seem to have disappeared.

Mario Becroft has kindly given permission for this to be reposted; his email and web addresses have been updated and are correct as of February 2003.

<BEGIN>

TT_KEYBD.ASC : copyright (c) Mario Becroft 1997.

FUNKEYWARE.ORG - TT_KEYBD.TXT - 11.07.1997.

NOTE: The following text explains how to fix a defect that plagues both Mega STe and TT keyboards alike, making the CONTROL key inoperative.

Preventive maintenance on keyboards not yet affected should also be performed. This involves opening your keyboard as explained below and sticking a length of insulating tape over sensitive areas, to prevent the mylar from eventual damage. While every precaution has been taken to ensure accuracy of information, neither Mario Becroft nor Funkeyware offer any guarantee about the results.

ATTEMPT AT YOUR OWN RISK!!!

Date: Fri, 27 June 1997 11:13:22 +0000
From: Mario Becroft mb@tos.pl.net
To: q-funk@megacom.net

DISCLAIMER

While I believe that the repair described in this document is reliable when carried out correctly, and while I have made every effort to ensure that this document is accurate, I can offer no guarantee with regards to the repair, nor your workmanship in completing the repair. I am confident that the repair will work, if completed with reasonable care, but I cannot guarantee this. CARRY OUT THIS REPAIR AT YOUR OWN RISK! If you do not think you are able to complete the repair, I advise you NOT to attempt it.

THE REPAIR

A common problem with TT (and presumably M-STE) keyboards relates to the control key. After a period of time, the control key will cease to operate. This problem happens because an edge in the internal keyboard casing rubs on the keyboard mylar and eventually rubs through the track that connects to the control key. This problem does not appear to affect any other keys.

If the problem has not yet occurred, it may be advisable to take preventive action. Although I have not tried this, I suspect that by either putting a protective covering of some kind over the track, or by carefully filing away slightly the plastic casing in the affected area, the problem could be avoided.

If the problem has already occurred, fixing the problem requires rejoining the broken track. The method decribed below has been used on a number of TT keyboards and, provided it is done with care, seems to have a very good successs rate. Every keyboard that I have repaired in this way has worked flawlessly ever since.

You will probably be able to complete the repair in an hour or so. Be sure to read the instructions completely before carrying them out so that you are familiar with the repair. Take it slowly and exercise care in completing the repair.

First the keyboard must be disassembled. The removal of the three screws that are present underneath the keyboard will allow the outer casing to be removed. It is then necessary to disconnect an earthing wire by unscrewing the connector, and it would be advisable to unplug the two ribbon cables joining the keyboard unit itself to the PCB.

At this point you should have the black plastic keyboard case with metal backing completely disconnected from the keyboard casing and PCB. You can now proceed to removing the metal backing from the keyboard. The backing is attached by a great number of clips: each of these clips must be carefully opened. An easy way of accomplishing this is to work from one side to the other, until the backing is disconnected from all the clips.

You should now observe the keyboard mylar, which can be removed from the keyboard. The mylar is where the problem lies, so the rest of the keyboard can be set aside while you work on the mylar.

Looking at the mylar from the top, you will observe a track at the far upper left hand corner that connects to the control key. The upper left hand corner portion of this track is where the problem lies. The break may not be visible at first but, by careful observation, a rough breakage in the track should become apparent. Fixing the keyboard requires rejoining the track at this point.

EXTREME CARE is required in carrying out the next steps, particularly when punching the holes in the track. Read throught the next steps carefully before you start so that you are familiar with what you are doing. Take it slowly and carefully, and the operation will most likely be a success.

Examine the area around the breakage. You will be punching three holes in the track, evenly spaced approximately 5 mm apart on either side of the breakage. These holes need to be EXACTLY IN THE CENTRE of the track and must be VERY SMALL. You will need a needle with fine point (such as a sewing needle) to make these holes. A single strand from a multi-strand wire will be later threaded through the holes, and the wire must fit firmly, not loosely, in the holes. Therefore the holes must be very small.

Working out from the breakage, and with the aid of the needle and a magnifying glass, VERY CAREFULLY make three holes on either side of the breakage, evenly spaced approximately 5 mm apart. Ensure that the holes are EXACTLY IN THE CENTRE of the track and VERY SMALL. Make the holes one by one, and check that each hole is the right size before you make the next hole. Check the size by attempting to thread a single strand from a multistrand wire through the hole. The strand should fit firmly in the hole. Remember, there is no going back once you have made the holes, so ensure that you make them very carefully and accurately.

Now that the holes are complete, it is time to thread a single strand from a multistrand wire though all of the holes. Get a piece of multistrand wire and extract from it a single strand, long enough to cover the length of all the holes you have made in the mylar, with substantial length to spare. Carefully thread the wire through the holes one by one, pulling the wire tight after each hole. Leave a short length (a few mm) protruding from the first hole. The wire should fit firmly in the holes, and it will require care to thread the wire through the holes because of this firmness. The wire should be threaded alternately up and down through the holes so that it joins the track where the breakage is. When you have finished, cut off the ends of the wire so that a few mm of wire is left protruding from the end holes. Pull these ends tight and push them flat against the mylar.

The most difficult part of the repair is now complete. It is still necessary, however, to finish the repair properly. If the wire you have added makes electrical contact with the metal backing that attaches to the keyboard, the keyboard will not work. For this reason, it is necessary to place insulating tape between the wire and the metal keyboard backing. It is also important that the wire does not touch

any other tracks on the mylar, or obstruct the passage of any keys.

Once you have ensured that everything is as it should be, it is time to reassemble the keyboard and try it out. Reassembly is generally the reverse of disassembly. Reattach the metal backing (which is much easier than detaching it), then reconnect the two ribbon cables and the earthing wire. Do not entirely reassemble the keyboard; instead, plug it in in its partially assembled state and test it. Check that ALL the keys work. In particular, check that the control key works. Check that random characters are not sent when the control key is pressed. If all is well, you can finish reassembly of the keyboard - you have finished. Congratulations!

If there was a problem, then check, first of all, that the two ribbons are correctly and fully in their sockets; and ensure that the metal backing on the keyboard is fully attached, with all the clips attached correctly. If it still does not work, determine the symptoms of the problem and refer to the following list of possible causes:

* The control key does not work, but everything else it fine.

This means that the repair has had no effect. Remember that the wire must join the two sides of the break in the track.

The holes should be either side of the break, and the wires should join the break. Check that the wire fits firmly in the holes and that the holes are exactly in the centre of the track. If the wire is not contacting properly, it may be necessary to remove the wire, add more holes and then get a longer wire and thread it through again.

* The control key does/does not work, but various other keys no longer work either.

This could happen because you have inadvertently damaged other tracks on the mylar while attempting the repair. If this is the case, you could try repairing those other tracks as well, although it might end up easier to just buy a new mylar.

This may also happen because one of the ribbon cables is not inserted correctly and fully in its socket.

* The control key causes random characters when pressed.

This happens when the wire you added is making electrical contact with the metal keyboard backing. Ensure that insulating material is present between the wire and the backing so that electrical contact cannot occur.

CONCLUSION

If you have carried out the repair, chances are you now have a working control key. Congratulations!

If, however, the repair was unsuccessful, you may attempt to rectify
the fault yourself. Provided you carried out the repair as described,
I do not believe there is much that can go wrong.

I do not want to receive huge amounts of email from people who have
problems with this repair. You carry out the repair at your own risk.
If you do need to contact me for some reason, however, my email address
is given at the bottom of this document.

Good luck!

> the clips.

These clips brake off real EASY as I know all to well, that's why my KB has been
dead for 3 years now. And once broken there's no way to fix them either.

Hi!

Sure - Fontname, which comes with NVDI. It's in the NVDITOOL.S
directory. I have installed it as an application for TTF and SPD,
so double-clicking a font file displays it in several sizes and
gives details of the font. It also gives you an option to install
the font, copying it to your main vector font directory as given
in NVDI.INF if it isn't in there already (in my case BTFONTS).

There is also the German Arkus, which does rather more, like
displaying the complete character set, allowing renaming and some
repairs etc. There is a free demo of Arkus2 around, I bought
Arkus3 for around 50 DM. Comes from Pergamon in Kronberg
(pergamon@compuserve.com or m_herzog@t-online.de). My version is
in German, but there is also an English one available (don't know
if the manual has been translated).

Regards, /Peter/
The Truetype font format is described in longish file (which makes
a pretty thick book when printed out) published by Microsoft. Look
on the net for TTSPEC10.ZIP - about 560 KB. (There may be a later
version now.

>but has anyone had success with printing in Nemesis High mode (50MHz) using
>Magic/NVDI?

Hi Mike!

Yes, I do it all the time. For text I tend to use IdeaList, but
also print from various graphics programs, Everest, 1st Word Plus
- almost anything. This is using both NVDI 5 and MagiC 6.10.

>I've read something about using a Spooler, but the ones I've found don't
>help at all (unless I'm using them incorrectly).

There is a spooler called Magic Spooler by Emanuel M�cklin
(MS_SPOOL.PRG) and FASTPRINT.TTP asnd some others which come with
NVDI, if I remember correctly. I use one (I think NPRINT) to
permit background printing from the NVDI global print dialog.

Source record: 29386

I'm looking for a replacement color monitor for my STE. My old SC1435 died, so I'd either like to pick up another one of those, or more likely, an SC1224.

I'd prefer to find one in my area (Los angeles, California - USA) to avoid hefty shipping charges, but I realize that might be difficult.

So, anyone in the USA (or Canada, I suppose) that has one available, please either respond here, or send me an e-mail. Also, if anyone can recommend any web sites / dealers etc. that might have some, I'd appreciate that too. I've found a couple on eBay, of course, but I'd like to look in a few other places as well.

Thanks.

It seems I did not recognize its possibilities when I installed NVDI
and looked through the add-ons. Only thing I did not yet check is
if it deletes a font (from BTFONTS) when I deinstall it.
Also it would be nice to be able to rename font files. But otherwise
it's quite usable.

German is no real problem since it is my native language :)
Pity that with google I did not find the demo. At the Pergamon
homepage I also couldn't find it :(

Hi, I have a schematic of a mod using a 74F04, it worked on both my Falcons. 1 runs Hddriver and the other AHDI. I will scan it and e-mail. It seemed more reliable than the other two 74F08 mods. I had a simillar situation, a butcher had attempted it and screwed it up. The 04 version is good in that the tracks don't need reparing.

The Milan have a complete different hardware than TT/Hades/Falcon. It
would require special Linux kernel support.

Btw. there is an ongoing port of NetBSD to the Milan hardware. I don't
know how stable it is so far. Take a look on the NetBSD ATARI page:

Much easier would be to use an freely available font renderer like the
freetype library. This library is already available and can handle TTF
fonts very well.

Hello.

If the risks and description of how to repair your TT mylar puts you off attempting it I still have new Mega STE keyboards for sale. You can take the innards out and rebuild into your TT case or just use it as is.

Current UK price is £10 sterling plus post. Total for US customers inc shipping is $40 US.

Hi Galen,

>I did a quick search for CRW-F1 and didn't come up with any hits under
>$230. Do you know where I might find the CDRW at the price you
>quoted?

Well, not in Belgium for sure;-)
If you happen to live in Europe then Germany is the country to go to for bargain hunting. But you shouldn't waste any time, Yamaha has stopped the production of CD-RW's all together and the remaining stocks don't seem to be very large...

http://www.alternate.de for $129
http://www.mix-computer.de for $105
http://www.snogard.de for $109
http://www.avitos.com for $119

The plain IDE version costs on average $80, there are more dealers then the ones quoted above but these accept payment with credit card or COD and send goods to most European countries.
If you happen to live in the States, then the first URL (Alternate) is the one to choose from, they send goods all over the world, and they happen to be ex-Atari dealers as well.

Cheers from Belgium
Dennis

Hi Derryck,

>>PS : (<-no it's not your initials (-;) I'm happy to see that Maus is
>>always alive ! How old is this good German BBS network ?
>
>A lot of useful utilities and info from what I can make out, is it possible
>to access this network from other countries via the Internet?

The Maus network itself can not be reached via the internet, but some groups
are exported to USENET.

My ISP offers the following 9 Atari groups :

maus.computer.atari.hardware
maus.computer.atari.talk
maus.computer.atari.mint_mtos
maus.computer.atari.dtp
maus.computer.atari.gemini
maus.computer.atari.falcon
maus.computer.atari.software
maus.computer.atari.spiele
maus.computer.atari.internet

If your ISP don't offer these, ask or demand that they do, alternatively you
can also use Google ofcourse. Keep in mind that these are German groups, all
messages should be in German and they don't like anonymous posters. All the
messages are im/exported to USENET twice a day, so don't expect an immediate
reply either.

Cheers from Belgium
Dennis

I've updated 6 of my 8 Catalogs, all 8 Bit and ST. Adding many new items!
Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari
Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods!
So not only do I sell NEW Atari Goods at a competitive price, I also sell
used Atari Goods you may not be able to find anymore at Swap Meets, Thrift
Stores or even Auctions Sites! And I sell for less! And unlike those who
will remain anonymous! I test Goods before I sell them. I can afford to
sell for less because I keep overhead down, avoid making promises I cant
keep and avoid offering services I cant follow up on! So not only can I
sell you some Great New stuff! But I can sell you hard to find 2nd Hand
Goods, partly because I'm the guy most people come to when they want to
give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion!
Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org
Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974!

No deletion, it makes use of a HIDE folder in your vector font path.

>Also it would be nice to be able to rename font files. But otherwise
>it's quite usable.

There doesn't seem to be any point, once Fontname's done its job you get
neat folders named for the fonts they contain :-)

My complaint with Fontname is that it doesn't show the fonts that are
installed unless you drag them all to its window. I can't see why it can't
read your NVDI inf file and fill its window with the fonts in that path
IYSWIM.

Cheers

Derryck

That's nearly as good. Then I only have to delete the contents of
the HIDE folder after using Fontname.

From the little bits of info that the Linux-m68k guys sent me I am not even sure that Linux will install on a Hades060 or a Falcon CT60 without resorting to the 030. You have a Falcon040 and it would probably work quite nicely on that.

I could send the installer files (2Mb) to anyone interested in giving it a try but you will need the other 3 CDs to do the install. They can be downloaded with a fast connection.

I had a look at NetBSD. Version 1.6 is a 75Mb CD ISO download but is missing the vital floppy boot folder from which the installation starts. Unlike Linux it is more of a DIY install. Not a serious problem but I didn't want to waste too much time so Linux was the obvious choice.

I will be sticking with FreeMint I just wanted to be able to configure my router using a JavaScript browser like Netscape. I installed X11 and tried the Dillo browser but it looks less well developed than Highwire.

Regards,

Peter

821. Advice requested for Falcon Tower

Newsgroup: comp.sys.atari.st
Date: 2003-02-13 22:12:24 UTC
From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0302131412.6d8d5420@posting.google.com>
Source record: 29302

Hello everyone,

Over the last year or so, I've been putting together the materials required for a "Super Falcon" (video card, CT60, etc.). Now the time is coming to recase my machine, and I've been carefully studying the various websites relating to this task. However, I'm coming up with a few questions, which I hope will generate discussion amongst this group.

1) Why can't the Falcon's board be mounted flush with the back of a tower case? I've been seeing a lot of rerouted ports and I can't figure out why I can't just cut the tower case's back to match the Falcon's back.

2) Once the HD, CT60, video card, etc. are mounted on the motherboard, what is the risk of stress to the mounting points? It strikes me that the torque might be sufficient over time to cause stress fractures.

3) How much heat does the Falcon generate? I have (actually, my wife has) a Powermac DP 867 that is ridiculously loud. I would like to provide sufficient cooling of course, but through the use of thermostat controlled fans I'd like as quiet a machine as possible. Is a single 60mm fan enough (in addition to the power supply's fan, of course)?

4) I'm a bit worried about the keyboard. I've sent emails to Laurent regarding his Eiffel device, but so far without response. As a backup, I'm thinking of making a cable to use the Falcon's original keyboard in the (now otherwise empty) original case. Are there any maximum length issues that have come up?

5) I seem to recall that dual IDE is possible in a Falcon, but there are cable length issues. Can anyone add detail? Are there any current 30GB (the smallest I can find!) drives incompatible? Is there a recommended CDRW make? [I hope to reserve the SCSI bus for the Ethernet adapter I have, if possible.]

In short, I welcome any comments. My stock Falcon will continue to run for quite a few more years under Geneva/Neodesk, but I'm looking forward to creating a beefed up Mint-based system.

Galen

You can use a standard Mega ST /Mega STE/TT kbrd, which I happen to have in
stock, NEW.

I have supplied these with 6ft/2m extensions with no problems reported.

G>thermostat controlled fans I'd like as quiet a machine as possible.
G>Is a single 60mm fan enough (in addition to the power supply's fan, of
G>course)?

I have a falcon in a PC tower case with a harddisk, a cd-rom, a cd-rw, a nova graphics card, an afterburner running at 32MHz and some additional stuff (like a PC-keyboard connector etc.) and all I need is a single thermostat controlled fan for the power supply.

BTW, you don't recognize that it is an ATARI (altough it wasn't my intention to hide it) when you have a first look on it because I am using a Logitech wireless desktop (keyboard and mouse) a NEC VGA monitor and as above mentioned a tower case.
So whenever there is a new person visiting me they always say: "Oh, your PC :-) is so quiet. What have you done that it is so calm?".

Then the next surprise for my visitors is when they see my falcon running. A few days ago someone said: "I can't believe your computer is running at 32MHz. Its as fast as my 450MHz computer running with windows."

At that time I was programming while listening to some MP3 files with Aniplayer so the cpu load was ~ 20% for sound output. =8-)

G>current 30GB (the smallest I can find!) drives incompatible? Is there
G>a recommended CDRW make? [I hope to reserve the SCSI bus for the

I am using a YAMAHA IDE drive. I once used a SCSI 8424S drive but due to the fact that it had a very noisy fan I replaced it with an equivalent IDE drive. Anyway, both drives work flawlessly.

Hi Dennis!

>The Maus network itself can not be reached via the internet, but some groups
>are exported to USENET.

Sure, I've posted in the Falcon group before (and in English!) :-)

It was the actual programs that are or were available that I was meaning.

Cheers

Derryck

>the HIDE folder after using Fontname.

I'd be inclined to just leave that folder, unless you're planning on never
changing your basic font set.

Cheers

Derryck

>Over the last year or so, I've been putting together the materials
>required for a "Super Falcon" (video card, CT60, etc.). Now the time
>is coming to recase my machine, and I've been carefully studying the
>various websites relating to this task. However, I'm coming up with a

One of our club members is embarking on the same project and has spent some

time researching this subject and has tracked a large-enough case down (I
don't know if he's got it yet).

>3) How much heat does the Falcon generate?

Not much, going by the size of the fan that it's fitterd with. My CT2'd
Falcon relies only on that fan, relocated to above the PSU heatsink, and
the fan fitted to the CT2's processor. The PSU you will be using will have
its own fan as you say, as will (presumably) the CT60. I'd guess that the
PSU fan could be slowed down as the PSU will only be supplying a fraction
of the power that you need. A 47 ohm resistor of a few watts in series with

one of the fan's leads would probably do it if you don't want the expense
of a thermo control. Suck it and see :-)

>4) I'm a bit worried about the keyboard.

I think longer cables should be OK, as long as you don't go overboard!

>5) I seem to recall that dual IDE is possible in a Falcon, but there
>are cable length issues. Can anyone add detail? Are there any

Sure, keep the cable as short as possible because the IDE bus is connected
to the processor. A foot or maybe two? What lengths do PCs use?

As for drives, I don't think that there's enough experience around yet but
any modern drive that will work with the CT2 should be OK? Usual caveats
with drive size will apply I should think. I'd be concerned about
compatibility with MagiC, you need to apply a patch to MagiC to make it
work with the CT2, although you're suggesting a MiNT system.

Cheers

831. Looking for info on MegaST graphic card.

Newsgroup: comp.sys.atari.st
Date: 2003-02-14 11:25:07 UTC
From: dp <dp@no_spam.jumphog.org.spam>
Message-ID: <oprkk0obx4xmvqwm@news.btinternet.com>
Source record: 29308

Hi all, I've recently got hold of a graphics card for my megaST, but need
some
info about the pinout and drivers for it. Its an Image systems ATR-4CP,
what I've found so far is at:

http://www.btinternet.com/~jumphog/atr-4cp/

If anyone still has one of these or has any info Id be really grateful.

Thanks, DP

832. Re: CD-RW on Falcon

I'm curious about your statement that "Yamaha has stopped the
production of the CD-RW's all together". As of today they are still
advertising it on their website, and there are many retailers that
still offer it (provantage.com, plus 12 retailers on cnet.com),
although some show it on backorder.

Maybe this is a "Europe Only" thing?

I'm just trying to confirm whether this is a rumor or fact. What is
your source?

>

THINK IT SHOULD BE CHEAPER? MAKE AN OFFER!

1040STe computer bare, add $10 for a mouse, $3 for manual, $1 for power $ 63
cord

1040STe computer bare, all working $ 63

1040STf computer bare, add $10 for a mouse, $3 for manual, $1 for power $ 49
cord

1040STf computer bare, needs repair: slight wobble in picture output and $ 21
internal floppy drive is dead, everything else appears fine; fix or use for
parts; add $5 for a mouse, $1 for manual, $1 for power cord

1040STfm computer bare, add $5 for a mouse, $1 for manual, $1 for power $ 56
cord

520ST computer (no DD or PS), bombs & won't boot $ 10

520ST computer, all working, incl TV RF convertor & cable, incl power $ 20
supply; external floppy drive and mouse sold separately

520STf computer no floppy disk drive; incl power supply; add $5 for a $ 13
mouse

520STf computer with DS external disk drive, add $5 for a mouse $ 27

520STfm computer dead internal power supply (looks like it melted down); $ 15
probably repairable or certainly usable for parts; this is the model with
internal DSDD floppy drive and TV output

520STfm computer with internal power supply & DSDD floppy drive and TV $ 15
output; dead floppy drive

CABLE 25PIN Modem/serial/printer cable 25 male to 25 female Dsub approx $ 2
8'

CABLE weird unidentified cable 3', 2 identical connectors, 6 pin, $ 13
arranged 2-by-3 with the middle 2 offset higher than the outer 4

CD-ROM SCSI 1X Chinon CDS-435 was working fine but now just ejects disks $ 3
when inserted, has recent ROM upgrade

FLOPPY 3.5" Atari external floppy drive, tested ok, incl data cable & $ 27
power supply

FLOPPY 3.5" Atari external floppy drive; flakey - reads ok sometimes but $ 8
most of the time doesn't; perhaps fixable; sold as-is, incl working power
supply and floppy port cable

FLOPPY 3.5" Beast Systems FD-CUB external floppy drive, untested (ask), $ 27
includes data cable, no power supply

FLOPPY 3.5" Oceanic America Master-3S external floppy drive, incl data $ 26
cable and power supply

FLOPPY DISKS quantity 10 DSDD namebrand 720k disks pre-used, no $ 1
guarantee but should work fine

FLOPPY DISKS quantity 20 DSDD noname 720k disks pre-used, no guarantee $ 1
but should work fine

FLOPPY DISKS quantity 7 DSHD noname 1.44M disks pre-used, no guarantee $ 1
but should work fine

HARD DISK DRIVE Atari SH204 in external shoebox case, incl DMA and power $ 34
cable, computer won't recognize drive: it spins up and can hear it seek

HARD DISK DRIVE Supra 30MB in external shoebox case, incl DMA and power $ 69
cable, original box in great condition, tested working, formatted

HARD DISK DRIVE Supra 30MB in external shoebox case, incl DMA and power $ 104
cable, original box in great condition, tested working, formatted, ** I think
this was a brand new drive! I formatted to test, no bad secs

JAGUAR/STUG T-SHIRTS (ONLY 1 LEFT!!) gorgeous black XLG Fruit-of-the- $ 7
Loom T-shirts with our Atari club's logo on the front and on the back "Jaguar"
in huge red lettering (like on the Jag box) with eerie yellow eyes above it
and "64-bit interactive multimedia system" written below, Brand new never worn
leftovers from a show we attended

JOYSTICK Archer upright joystick, with base and thumb fire buttons, $ 6
untested (ask)

JOYSTICK Epyx 500XJ joystick - minorly broken, probably fixable or usable for parts $ 1

JOYSTICK Epyx hand conformed joystick $ 3

JOYSTICK QuickShot Wizmaster gamepad-like controller & joystick, rapid fire option $ 17

JOYSTICK Wico upright joystick, with base and thumb fire buttons $ 10

JOYSTICK sold as set: 2 Wico hand-formed joysticks, 1 in perfect condition, 1 sticks a little $ 1

MAGAZINES great deal! over 150 UK & USA Atari mags PLUS 120 original magazine cover disks in one super cheap set! email for titles (mostly UK), shipping not included $ 41

MODEM EXTERNAL 1200 baud Atari classic, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 3

MODEM EXTERNAL 1200 baud CapeTronic w/builtin AC adapter & volume control, great starter modem for older computers, incl phone cable, serial cable add $5 $ 3

MODEM EXTERNAL 1200 baud Packard Bell, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 3

MONITOR Master switch between color & mono with a flick of a button! $ 3

MONITOR color Atari SC1224 minor problem: the power button switch won't stay pushed in unless you hold it; fix or replace with a switch from Radio Shack; otherwise works perfect with great picture $ 13

MONITOR color Atari SC1224 new style 1989 work great except if you power off the computer you must power off/on the monitor $ 34

MONITOR color Atari various models working $ 26

MONITOR mono Atari 1991 model small, grey made by Quadrant, flakey, picture won't sync (wobbly,distorted), maybe fixable $ 16

MONITOR mono Atari various models (SM125,etc) working $ 24

MONITOR mono Atari various models dead $ 8

POWER SUPPLY external for 520 ST's $ 13

PRINTER SUPPORT STAND 2 plastic legs to hold printer above paper, best with larger dot matrix printers, sturdy smokey-clear plastic $ 1

PRINTER SWITCHBOX 25-pin for modems or printers, broken or miswired: does strange things $ 3

ROLAND D-50 Synthesizer, great condition classic synth, includes MIDI cables $ 463

SPECTRE GCR the premiere Macintosh emulator - complete and upgraded with $ 13
ROMS (disk/docs/cable)

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $ 9
clock automatically every time you boot. Incl box, software and hardware.
Suggested retail was $57.95. Brand new. No guarentee on lithium battery
(estimated 10 year lifespan)

Yeah, but it is worth it. I played Ultima 1-6 on my Atari
computers and will soon do it all again. The graphics and sound
may not compare with today's games, but the gameplay is still the
same and that is what counts....

Oh, I completely agree with you. I have very found memories of
playing Exodus: Ultima III back in 1984 on my Atari 800XL. It was
with my best friend at the time (who, unfortunately was killed in a
motorcycle accident in 1987), and I think we spent about 2 weeks,
playing several hours every day, until we finished it. I still have
all the notes we took and the maps we drew for that game too.

The depth of game play of the Ultima series is amazing, you're right.
And the music (particularly the Atari 8-bit music) blew me away at the
time. In fact, it was one of the things that first got me interested
in electronic music (which I compose today).

I plan to play Ultima 5 (and pick up where I left off with Ultima 4
back in the early '90s) on my STE, as well as Ultima 6. Of course,
after that, I'll have to play the rest on my PC, but I'm sure I'll
still enjoy the experience.
;-)

Hi all!

A sad day has come to pass. Frontier Developments Ltd has requested the withdrawal from distribution of Elite: The New Kind (E-TNK) by Christian Pinder. All ports of the game have to be withdrawn also. This affects the Atari port which was released by Christian Putzig as an entry into the "Little Big Competition" by MagiC Online.

Here is the post from alt.fan.elite that announced this:

On 10 Feb 2003 20:45:46 , Christian Pinder wrote:

>Hi all,
>
>I received an email from David Braben today. He has requested that I
>remove all Elite materials, E-TNK (binaries & source) and all
>derivatives from my website. David is one of the copyright holders of
>Elite and is quite within his rights to request this. I am, of
>course, full complying with this request and have removed E-TNK from
>the NewKind website. I must also ask anyone who may have E-TNK, or
>one of it's ports/derivatives, available for download to remove it
>from their website.
>
>--
>Regards,
>Christian.
>http://www.newkind.co.uk
>.

I have therefore removed GEM-Elite from my website, and request that others do the same.

Cheers for now!

James

Hi folks

I've been using a useful POP mail tool on my STE for a few years. It's called POPwatch and it reached version 2.91 about five years ago. The developer included his email address and I've mailed it a few times over the years for some info on updates but he never replied. It's a decent client which has some useful features.

Anyone else used it and know where I can get an update or even whether there is one around,

Cheers
Al

850. MagiC and Falcon related questions

Newsgroup: comp.sys.atari.st
Date: 2003-02-17 08:19:48 UTC
From: Matthias Arndt <matthias.arndt@tu-clausthal.de>
Message-ID: <55025298.LEZc7GXDsk@jll.heim7.tu-clausthal.de>
Source record: 29331

Hello fellow Atarians,

I finally got a Falcon030 with a VGA adaptor. It came with MagiC installed on the harddisk and it works pretty good. Now I have a few questions:

a) which programs exactly force the Falcon to boot into MagiC? There are a few programs in the AUTO folder. Esepecially one called magxboot.prg but disabling it, the machine will still boot MagiC. All I want is to setup a dualboot environment to run MagiC as the main OS but have the normal singletasking TOS available as backup at boot time.
b) Is XBoot Falcon compatible? If yes, could it solve the problem above?
c) Can MagiC run applications in singletasking mode like non-GEM games and demos intended for singletasking OS?
d) Do I need to park the harddisk or can I simply switch off the Falcon like my normal ST?
e) Are there tools that will allow TOS console applications (namely .ttp and .tos ones) to run in a window?
f) Can I use STing without a modem but a nullmodem connected to my Linux box for networking?
g) How fast is the builtin serial port of the Falcon?
h) Can I display all video modes on my VGA display?

TIA,
Matthias

>a) which programs exactly force the Falcon to boot into MagiC?

It is indeed magxboot.prg, this is reset-proof and the only way to boot into TOS after you've loaded MagiC is to perform a cold start/boot.

>b) Is XBoot Falcon compatible? If yes, could it solve the problem above?

XBoot will work with MagiC as you suggest. You must ensure that XBoot runs first in your Auto folder. There might be an issue though, as it seems that XBoot is packed and some versions don't unpack properly at run-time. I'm hazy on this, so take a look at the Google news archives as this was covered some time in the past along with some year 2000 problems IIRC.

>c) Can MagiC run applications in singletasking mode like non-GEM games and
>demos intended for singletasking OS?

You can run programs in single-tasking mode, but that's no guarantee that all your progs will work especially games and demos.

>d) Do I need to park the harddisk or can I simply switch off the Falcon like
>my normal ST?

Under single TOS just switch off, under MagiC use the Shutdown option.

>e) Are there tools that will allow TOS console applications (namely .ttp and
>.tos ones) to run in a window?

VT52 is the supplied app for MagiC, no idea about TOS.

>f) Can I use STing without a modem but a nullmodem connected to my Linux box
>for networking?

I believe so. Look in Google for some info?

>g) How fast is the builtin serial port of the Falcon?

115200 is absolute tops, half that for better reliability. You need HSModem installed.

>h) Can I display all video modes on my VGA display?

Higher resolutions and colour planes lead to slower operation and more flickering.

An accelerator together with a SCSI patch mod. should be on your shopping list, can anyone suggest a source for Falcon speeders?

Cheers

Derryck

Thanks for this impressive amount of useful information.
I'll try Xboot for these unpacking issues. I hope it will work anyway.

About the HSModem package: The most recent from my favourite ftp site should
be enough or do I need a special version for the Falcon?

cheers,
Matthias

Hi Al,

�I've been using a useful POP mail tool on my STE for a few years.
�It's called POPwatch and it reached version 2.91 about five years
..
�Anyone else used it and know where I can get an update or even

Same for me. I'm afraid it wasn't any update, and it's sorry because
he is really good for recieving mails.

Regards

> problem.
>
> It stills a problem of timing when reading the Host of the DSP and the
> INT vector of the SCC. This problem is immediate when boosting the
> falcon motherboard to 20MHz. "

Trouble with SDRAM, DSP and some more cost time. I think anyone like to
get a bug free hardware. Long time for 400 Euro credit..

> I know that it is of paramount importance that the CT060 is delivered
> without bugs, but just to get the ball rolling, could purchasers whom
> will only be operating the CT 060 at 16Mhz bus speed have theirs
> delivered, or does the problem exist at standard bus speeds as well?

I hear some developers take boards, not others.
Not one other messages here. Iï¿½m not shure what they all get.

> If you're fighting the blitter on the Falcon, you may never overcome
> that darn Combel POS. Just turn it off after you load CT ROM into fast
> ram.

Best way is to ignore the blitter completly :->
(Anyone use it?) >:)

> Personally, I will install a header for a NOVA adapter, clock the DSP

I like to take the board to fit one of the last falcon left here.
After that long time iï¿½m not realy amused. Normaly itï¿½s time to
get the money back.

Regards, Robert

Anyone know of a reasonably reliable and quick FTP site where I can download the Automation CDs and the CDs from the Pompey Pirates and D-Bug etc?? Any help is very much appreciated!

Thanks,

Geordie

SCC & DSP problems are not fixed today, but some extra features like
Ethernec on cartrige port works fine, or power off after a shutdown
under MagiC.
My CT60 runs at 72MHz and the bus at 16MHz.

> I know that it is of paramount importance that the CT060 is delivered

At this time Rodolphe try to fix problems when the cache is used for the
SDRAM (copyback and writethough), because the 1st program who run in
SDRAM crash in acces fault.
Blitter patchs works with SDRAM/STRAM but I need to look interrupts with
the blitter is used (it's a strange problem), otherwise the system is
frozen. => TOS with SDRAM can start without NVDI (with ALT or CTRL for
exemple).

TOS is ready and my FALCON works fine with 256 MB of SDRAM but _without_
cache (set by the PMMU, the STRAM works with cache in writethrough since
a long time). Excepted SCC.PRG and SERIAL.STX (sting), I can use my
standard config under MagiC (this config was used under the CT2B).
I need to test the patched DSP routines.
I can use Aniplayer if I remove the DSP.
FPU 68882 programs works fine without other patches but is better to use
FPU__3.PRG (from Hades) in the auto folder (faster with sin, cos,
etc..).

TOS, tools, cpx, MagiC patches, tests are in this archive :

http://didier.mequignon.free.fr/files/ct60_404.lzh (1,2 MB)
This file is updated each week.

All features of the CT60 cpx works like programmed shutdown, temperature control, load display, TOS in RAM, etc...
Like the CT2B there are a GEM program for update the patched TOS.

Rodolphe use all his free time for send card in the best time, so please wait...

Regards,

Didier.

It's surely a good piece of soft. It's also good for deleting spam as one
can view the mailbox without retrieving the content. On my Hades I used
until recently only Popwatch to retrieve/send mail. Unfortunately my ISP
has change something in their setup. I believe they are experimenting with
anti-spam soft. Anyway since then most of the time I can't download mails
holding attachments completely. Somewhere in the middle of the download I
get a warning like this: CNbyte_count: -32731 Unrecognized error.
This means I usualy can see the plain text but not the attachment itself.
Quite annoying.
It needs to be update but alas the author seems to be disappeared from
earth.

CU,
Martin

Everyone,
I agree with everyone that it is quite painful to
sit and wait for a card that was paid for over a year
ago. BUT, I for one am willing to wait till the card
is in perfect working order according to R. Czuba and
Didier M. I dont expect a perfectly working card if I
got it early while they are telling everyone that
there is a problem. I would think that anyone that
paid this much for a card of this nature would feel
the same way. I have all the confidence in R.Czuba
and Didier M. that they will squash all bugs that they
have told us about on CSAST. Just give them some time
and hopefully all will be well soon. I bet anyone
that has ordered this card as soon as they got it they
would put it in, NO matter what they were doing.

Thanks,

Carey Christenson

Barrie,

Thank you for the information. How is the Mega keyboard plugged into
the Falcon motherboard? What options are available for the mouse?
How many keys on the keyboard you sell differ from the US or UK
layout? Can I pry off my Falcon's keycaps and transfer them to the
Mega board?

My apologies for all the questions, but I'm not sure how your Mega
board would work out.

Galen

> don't know if he's got it yet).

I don't think a mid-tower (20.4 inches) will work. It might, but the
Falcon's motherboard is roughly 18 inches in length, so I suspect a
full tower (about 25 inches tall) is needed. Does anyone have a
recased ST or Falcon in a mid-tower case?

I've wondered about the Falcon's fan, as it doesn't seem to be in a
place that would be of any use! (Most of the generated heat is to the
left, by the power supply). I don't mind the expense of a thermostat
(though I hadn't thought to put it in the PSU). This machine is going
to cost well over $1000 by the time I'm done (unfortunately), so I
guess a bit more won't matter.

The shortest PC IDE cable I've found is 18 inches. 24 inch cables are
quite common. My main concern is getting too long -- I'd like to
connect both a CDRW and a HD to the bus, and unless I use a 2.5" HD
and the Falcon mounting hardware (which I don't yet own), I don't see
how I can do both with less than 18" of cable since I have to run from
the Falcon to the HD and then to the CDRW (or the other way around --
I've forgotten if the cable end is slave or master -- have to look
that up!). I do have a spare SCSI CDR, but I'd like to leave the SCSI
bus fairly open.

Yep, MiNT. My current Falcon is a Geneva/NeoDesk setup (and still
does everything for me but browse the web), but I think my experience
in Linux makes MiNT/XaAES the best choice for my next machine.

Check. Try one fan at first. Are your HD and CDRW both IDE (you
mention the CDRW is)? If so, how are they connected physically?
Also, what PC-keyboard connector do you use?

Hello everyone,

Allow me to summarize what's been learned so far:

> 1) Why can't the Falcon's board be mounted flush with the back of a
> tower case? I've been seeing a lot of rerouted ports and I can't
> figure out why I can't just cut the tower case's back to match the
> Falcon's back.

No answer to this as yet. Tower owners, what was your rationale for
rerouting the ports?

> 2) Once the HD, CT60, video card, etc. are mounted on the
> motherboard, what is the risk of stress to the mounting points? It
> strikes me that the torque might be sufficient over time to cause
> stress fractures.

A partial answer to this. The CT2/Nova combo is also a double-mounted
card and apparently no damage has been done. Frank, can you verify
this?

> 3) How much heat does the Falcon generate?

Very little, apparently. I'm going to try putting a thermostat in to
control the PSU fan as the sole fan.

> 4) I'm a bit worried about the keyboard. I've sent emails to Laurent
> regarding his Eiffel device, but so far without response.

6 feet appears OK. I wonder what happened to Laurent? He's not
returning my emails.

> 5) I seem to recall that dual IDE is possible in a Falcon, but there
> are cable length issues. Can anyone add detail?

A partial answer. Most/all drives work, but cables must be kept
short. Can anyone who uses dual IDE mention the length of their IDE
cable?

> In short, I welcome any comments. My stock Falcon will continue to
> run for quite a few more years under Geneva/Neodesk, but I'm looking
> forward to creating a beefed-up Mint-based system.

This is still true,

Galen

Hi all

BIG Atari-MIDI Fair in Holland

Atari-MIDI member JosTosBond(as he is called in our forum...and DON'T ASK!:-) is having a Atari-MIDI fair this coming up sunday. If you are in that neck of Atari-World, please email Jos for more details. It looks like a good turnout so far. I wish I could be there, as I live in the states (CA)but will be there in spirit.

For more info email Jos:

"Jos Vlietstra" <jo.vlie@hccnet.nl>

Below is Jos's post on the Atari-MIDI forum about the fair.

Tim Conrardy
Tims Atari MIDI World

I've been trying out K. Ellis' POPGEM with very mixed results. The latest
version from her web page doesn't work under MagiC and earlier versions don't
seem that reliable either. You might have better results on your system.

Cheers

Derryck

>Falcon's motherboard is roughly 18 inches in length, so I suspect a

Full tower would give you plenty of room I should think, you could take a
cardboard template with you to the shops ;-)

>I've wondered about the Falcon's fan, as it doesn't seem to be in a
>place that would be of any use! (Most of the generated heat is to the

The PSU is the highest-stressed bit, so any cooling needs to be here and not in
some out-of-way space under the motherboard!

>The shortest PC IDE cable I've found is 18 inches. 24 inch cables are
>quite common. My main concern is getting too long -- I'd like to

Sounds like you might need to make up your own cable. Try not to go the laptop
drive route though, the standard size drives are much cheaper.

It's a worth-while project but a lot of work.

Cheers

Derryck

Risk of weakening the back panel by cutting. Looks neater with rerouted ports.

Cheers

...but I need your help.
Therefore I'm Amigian and have absolutely no idea with the ST, I need someone to build together an archive with Frontier for ST (as an disk-image for emulations or as an archive or whatever...).
I will tell you, what steps must be done.

I would then put them on my website, which has already the Amiga-versions of it to have a complete collection of Frontier for download on shareware-basis (paid to Frontier Developments) for A-systems ;)

Every help is appreciated including providing different languaged versions of Frontier or building up the archive, etc.

For everyone who wants to build up the archive (isn't hard) you should know how to use a hex-editor, because the Gametek-Konami Screens must be changed to Frontier Dev., etc.

If you're interested, please contact me under:westpdmkids@yahoo.de

Thanks in advance

Michael Asse

Although Popgem works quite good on my system I prefer Popwatch.
Anyway if I can't retrieve some mails I use Mymail instead. Mymail doesn't
have troubles with these mails.
I wonder where Gary Priest is. Mails, faxes, etc. remains unanswered.
Quite a pity.

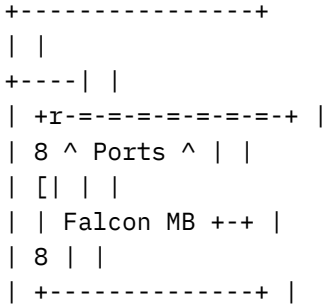
> recased ST or Falcon in a mid-tower case?

I do. It's a bit of a job, but it's possible. What you need to do, is get the back "port panel" un-riveted, so there's a large hole in the back. Then the Falcon motherboard fits in sideways (see diagram below). You then have to either leave the case open and run cabling through the hole, or make an extension of some kind to extend the "port panel" out past the end of the motherboard. Then you can make extension cables that go from new ports on the back to your Falcon's ports. Also, depending on the case and if you have something plugged into your DSP port, you may need to do some drilling and cutting to get everything to fit. But it works, if you're willing to put the time and effort into it. There'll then be enough room for your floppy drive and two or three (depending on if you had to cut through the bottom drive rack) CD-ROMs or hard drives, and maybe another floppy-drive-sized unit like a zip drive, depending on the case design. I personally like the look of the mid-tower better than the full tower. But that's just my own preference.

Diagram:



```
+----+----------------+
```

```
r = reset button
8 = MIDI and Joypad ports
[ = ROM Cartridge
= = Port
```

> Yep, MiNT. My current Falcon is a Geneva/NeoDesk setup (and still
> does everything for me but browse the web), but I think my experience
> in Linux makes MiNT/XaAES the best choice for my next machine.

I know it has a bad rap (reports of instability issues), but have you tried Geneva with Mint? If you can get the right combinations of AUTO folder order and which AUTO/ACC/CPX programs to use and not use, it really can be quite nice! Might be a good "free" intermediate step, if you're interested in such a thing. Mint seems to make Geneva feel just a bit faster to me. Use Teradesk or Thing, along with Boxkite or other long-filename supporting fileselector, and you're in really great shape, with most features of more "modern" Atari OS's.

Hallo !

G>1) Why can't the Falcon's board be mounted flush with the back of a
G>tower case? I've been seeing a lot of rerouted ports and I can't
G>figure out why I can't just cut the tower case's back to match the
G>Falcon's back.

There's no need to reroute the ports. I've got two "towered" Falcons, both of which present their own connectors at the back. The game- and midi-ports have to be rerouted, though, and ROM-Port cards have to be fittet directly inside the tower due to cable length issues.

One of the tower cases was custom-made, the other one I did myself. Take care to locate a tower case with the PSU located on top, not half way down on the back, as you'll have to move the PSU up otherwise!

mit freundlichem Gruï¿½ aus Bubenreuth

Everyone,
I have been pondering this for quite sometime also. What to do with my Falcon once I get the CT60. I also have the Eclipse and with both of these it would make it impossible to use the standard case. And I am not to fond of moving the motherboard out of the bottom half of the Falcon's stock case. So I think I have found a solution that would work for those who are interested in not moving the motherboard out of the bottom half of the Falcons stock case. I remember when I used to be press room lead that we had something called Lexan which is a clear plexiglass type of material. We used this for many things in our factory, one of them being square guards for our press dies. If we can use Lexan or plexiglass to do that. Why not make a rectangular box that the whole bottom part of the falcon will slide down in and have cutouts for accessing plugins on the back and the sides??? Also let us not forget that we will need one of those PS/2 adapters from Laurent in France I believe to make a PC keyboard work. We should be able to mount everything to the walls like create shelves or buy 5.250 in and 3.500 in. bays to mount to the walls for the hard drives and disk drive and mount the PS/2 adapter to the right side or front. Also another neat thing we could do is put NEON lighting inside this see threw case and put a big FUJI logo on the top that is recessed and has a frosted look I have access to milling machines that can do a very nice job and taking .125 of an inch out of .250 inch material is nothing. Not only that the top is on a hinge on the backside and you can lift the top off very easily to gain access to the inside. We could put temperature controlled fan(s) inside to keep the case cool. Let me know what you think guys!!!

P.S. JDR out of California has adapters for some of the ports on the back. Also make the back completely open on the first 3 inches so that you can gain access to the plugins on the back of the Falcon. The rest of the case will set like an old desktop computer about 6 to 8 inches high. Plenty of room to stack upgrades on top of the expansion port inside the falcon.

Thanks,

Carey Christenson

I was thinking much the same thing. A new top covering the old base
would work well. We would need a 3.5" internal bay, a 5.25" external
bay, mount points for the PS/2 adapter (anyone heard from Laurent?),
the power supply, and the VGA port, and openings to allow access to
the Falcon's existing ports and to allow cool air in. I'd suspect
(due to the power supply's size) that the top would have to rise a
good 8 inches above the tabletop. Don't forget that it has to be RF
shielded, or all sorts of strange things might occur.

I would be happy to purchase such an item, if it could be had for
under $100. If I do not recase into a tower case, I will probably be
hand-making a wood/aluminum top much as listed above.

Galen

A commercial solution was/is available, the DeskTopper. Take the top cover of your Atari off and replace with the DeskTopper - plenty of space and there's a shelf for extra drives, PSU, etc.

Cheers

Derryck

Source record: 29271

Galen and everyone who is interested,
I can make such an item as listed. I have access to
10 ft cutting shears that can cut through 1/2 inch
thick Lexan like it is butter. I have gotten a price
on Lexan from my work place and for a 4 ft x 4 ft
section it is 90 dollars. I would be able to make 2
cases at an 8 inch heigth from that material. I could
probably make such a case for between 75 and 100
dollars when it is all said and done. Plus shipping
and handling. Now mind you this will not give a power
supply or the PS/2 adapter. If people want that also
installed in the case that would be extra. I have not
made a prototype yet. But once I do, I will put a
message in here and anyone that is interested I will
send them jpg's of the finished product. I would also
expect most of the money up front for materials and
S/H once I know the address it is going to. I am not
sure what kinda of turn around rate. But I would
expect between 1 and 2 weeks people could have there
case. People would also have to let me know if they
want the power supply and PS/2 adapter also.

Thanks and let me know what you guys think,
Carey Christenson

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! I tried BubbleGEM with CAB 2.8 but it isn't much help. It is working, but
I'm only getting texts like

DialogID=$011A
ObjectID=000A

To me it looks like CAB 2.8 was released before it was really finished. Or
is there some file from CAB missing on my system ?

900. HELP!!!

Newsgroup: comp.sys.atari.st
Date: 2003-02-21 19:05:28 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <BA7BC71E.2ADEC%nameerf@flash.net>
Source record: 29282

Hello!

I've got a major problem, and need some advice...

Today I was playing around with the newest Aniplayer, and had gotten it set up fairly well. When I went to save settings, I got a "Fatal Error in GEMDOS" message from Magic. I've run into this before with various things, as Magic tends to have this error a lot on my system with no really negative results besides having to reboot, and wasn't too concerned until I did reboot.

First, the system crashed as it was attempting to load the hard disk driver. This really freaked me out.

I rebooted from floppy and manually loaded the hard disk driver and re-installed it. Tried rebooting.

The driver loaded fine, but now even though MAGXBOOT loads, it refuses to actually start Magic, and just continues loading the rest of the AUTO programs. After one or two of them load, I get two bombs. Another one or two load, and the whole system freezes up.

I cold-booted again, checked out all the AUTO program files and Magic's INF and RAM files, and everything seems ok. Just out of curiosity, I went to "Show Information" for drive C, and after a little hard drive access noise, nothing was displayed.

I also went to Aniplayer's INF file in the C:\GEMSYS\HOME\ directory, and it was 0 bytes in size.

I decided I should come here before attempting anything else. My assumption is that when Aniplayer tried to save its INF file, something bad happened, and messed up something in the drive's directory structure. But this may not be the case, and I haven't the slightest clue what's really going on.

Any thoughts? Thanks!

I think so. There are several *.HLP files, one of them CAB.HLP.
I just tried BubbleGEM with some of the modules (Autosurf, Cabcache), and
there everything seems fine, except that the help texts are in German.
But I'm using English RSC files. What language are you using ? Could it be
that something went wrong when I replaced the German resource files with
English ones ? I'll check that one of these days, I must have the original
disk with the German version somewhere.

I have just subscribed to the atari-midi mailinglist, so I'll be able to
make announcements there myself in the future.

> All the best and keep up the good work! (we all need encouraging now
> and then!)

Thank you. I'm still having lots of ideas. I'm learning to program with
the help of FaceValue/ErgoPro! now. This means my future projects should
have better compatibility with modern standards (A proper GEM interface,
MiNT/Magic compatible, drag&drop, VA-protocol...), very much unlike my
"classic" projects like YSEDITOR.

But programming takes time, and GOOD programming takes takes lots of time.
Which I don't always have :-(

My German CAB.RSC file was, renamed as backup, still in my CAB directory.
So I have tried it right away. When I had replaced the English CAB.RSC
file with the German one, BubbleHelp was giving normal (German) help texts
again! Strange, because as far as I could see with Interface, the Bubble
help texts are not in this file but somewhere else. ??

I'm using the German version. BTW, have you English *.hlp files? If those
aren't translated they will display in German, right?

See my answer above. What about the *.hlp files? Are they translated in
English?
Not sure but if they are in German it might explain why Cab English
version refuse to show the text.

TTFN,
Martin

Hi there, I usually use Google to read the comp.sys atari newsgroup.
So I didn't mean to do a universal search of the web for the info. But
if you search just in the comp.sys.atari.st newsgroup there seem to
be a lot of posts relating to the Barracuda. Also check a site called
A to Z cables for info on SCSi in general. I have a Barracuda as well
and I can't get it to work, but others have. Good Luck.

Hi Nick

We could always fake your kidnapping, you go to the event, i keep phoning 'her indoors', but any ransom she pays is mine!!, you just appear the following morning with a convenient 'roughed up' look and some rope burns. Maybe you could visit your 'bit of rough' on the way home, that'll save me smacking you about.

911. Silent Service help needed

Newsgroup: comp.sys.atari.st
Date: 2003-02-22 04:08:32 UTC
From: Buckiboy <jens-lippmann@t-online.de>
Message-ID: <b36t1k$1jpq06$1@ID-166930.news.dfncis.de>
Source record: 29292

Hi there!

Hope you have some nice time with your Ataris.
I need to know if there are any harbours in Sid Meier's Silent Service and,
if so, I need the locations.
On mission startup there's a difficulty setting named 'port repairs only' so
there must exist some but I never found any.
BTW I really would like to know to which island the most northern east plot
on the pacific ocean map refers to (that one where you start the training).
From its outline I'd say it's not Wake island, Midway islands or any
Hawaiian island (incl. Pearl Harbour). Damn this really puzzles me.

Any hint/help welcome.
Do you know if there's a conversion of Silent Service 2 for Atari ST?

regards
Jens (the mighty Buckiboy)

912. TOS floppy disk error

Newsgroup: comp.sys.atari.st
Date: 2003-02-22 07:25:58 UTC
From: d.w.vanderburg@student.tudelft.nl
Message-ID: <1e582fb0.0302212325.5539c85f@posting.google.com>
Source record: 29294

every time when I try to read from 7 floppies in a row (I was copying the KGMD distribution onto my harddisk) a GEM message pops up "insert disk 7 in drive A" and the system reboots. I've noticed this behaviour both under TOS 1.04 and 2.06. Is it a known error and does a fix for it exist?

kind regards,
Dennis

Midway, Marshal Islands, Guam, Brisbane, Fremantle (Perth) and one more I
can't name.

> On mission startup there's a difficulty setting named 'port repairs only' so

My .HLP files are in German. These are not simple ascii files, but binary files that are just a little bit more difficult/dangerous to translate.

I'm wondering how CAB "knows" if the .RSC and/or the .HLP file is in English, German, or Swahili ? I don't see any reason why an English version can't display German Bubble help texts ??

Midway, Brisbane and Fremantle.

>On mission startup there's a difficulty setting named 'port repairs only' so
>there must exist some but I never found any.

From page 8 of instruction booklet:

4) PORT REPAIR ONLY
If this level is selected repairs will no longer be accomplished
automatically while in battle or on patrol. Once an item of major
equipment is damaged, it may not be repaired.

You don't "dock" to a port, you just return to it. In the War Patrol
scree, when the screen turn green, you press the right mouse button to
end the mission.

917. CAB-able webcam

Newsgroup: comp.sys.atari.st
Date: 2003-02-22 16:16:48 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3e57a270.0@entanet>
Source record: 29202

I recently found a rather clever webcam in Zurich. As you know most webcams are either Java/Javascript or rubbish but this one shows how it should be done.

http://kamera.nzz.ch/cam.cgi

The camera shows views of the streets of Zurich and beneath is a panorama. Click on this and the camera will move to that position. You also have a choice of 4 zoom options (1,2,4,8).

The main image can also be used to re-centre the camera which is most useful when zooming in on a point of interest.

Well done NZZ.

(I have no connection with them, whoever they are.)

regards,

Peter

Thank you for starting this thread Galen, because I've been pondering this too. I've got a CT2B'd Falcon which I plan to leave alone. I've got a Nemisis Falcon, which is destined for the CT60. I hope I won't have to remove the Nemesis, and can run it at 20. Anyway, I hope to put the Nemesis falcon in a tower with a new IDE HD, My 4.5 Gig SCSI, My SCSI CDRW and a new IDE CDRW (Which I haven't bought yet!) I expect I'll need a big case to hold all that. I also use a Cartmaster light from Wizztronics to let me use my Steinburg and soundpool carts at the same time. (It holds 2 carts.) I wonder if it'll be a problem dealing with it? It would be nice if the Cartmaster lite were accessable without opening the case!

From what you describe, I think the FAT/DIR structure has been
corrupted :-(and I hope you have a recent backup.
If not, there are only a few utilities that can help you retrieving
your data :
- Diamond Edge (but only if your partition doesn't exceed 16 MB *and*
is 8+3 ;
- HPoptimizer, though I'm not sure at all ;
- Diskus, a commercial product from Uwe Seimet, maybe the only one
that I'd actually fully rely on if I had such a problem.

>Any thoughts? Thanks!

Sorry, I can't do much for you :-(

J.-Luc

921. New on TAMW: new version of KCS

Newsgroup: comp.sys.atari.st
Date: 2003-02-23 04:08:37 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0302222008.611b6cec@posting.google.com>
Source record: 29203

Hi All

The good DR (T) has approved of a ver 4 KCS (Keyboard Controlled Sequencer) with PVG (programmable Variation Generator) and Master Editor. I have repackaged the original ver 4 to include these vital additions along with Jeffery Raid Baker's Tempo Master MPE. The PVG Docs are also available.

KCS also runs on PC under emulation using Steem.

http://tamw.atari-users.net/steem.htm

For those who have not heard what PVG is about, please explore the link section on the below page, as well as try it yourselves. Please go here for the info and download:

http://tamw.atari-users.net/omega.htm

Enjoy!

922. New on TAMW: Dx7 page updated

Newsgroup: comp.sys.atari.st
Date: 2003-02-23 05:51:14 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0302222151.39d48f1f@posting.google.com>
Source record: 29204

Hi All

Just updated my DX7 page

1.Updated the YS Editor section with new updated links. Thanks Martin! Martins 4 op editors are excellent and can even import a wide selection of different sysex formats. There is even a convertor between FB01 and TX81Z formats. A handy tool.

2.NEW: from France. Marc Bareille has released a suite of programs for the ST and Falcon which include excellent editors for the DX six operator instruments as well as other synths. A whole library of sounds are provided as well. No documentation as of yet. Only what he could tell me , so I provided the txt file in the 030 version download. He has a nice web page devoted to it which includes the source codes. A PC version is also available, but not completly finished. The ST version however works under emulation on a PC with Steem.

The new material is at the bottom of the page.

http://tamw.atari-users.net/dx7.htm

Happy DXing!

>> is there some file from CAB missing on my system ?
>
>That is what happens here too, I never figured out why.

If you're using the DDP Translations package there is no English help file supplied. We didn't translate it and so it isn't included.

If, on the other hand, you bought the official English package that Atari Workshop sells and that we prepared, then please ask them for the missing CAB.HLP file.

Be aware that one or two bubblegem texts are misplaced and some missing, this is most likely because the resource has altered slightly since the last official English release, which IIRC was 2.7.

Cheers

Derryck

Would you just grow up. Ben is just trying to let the community know that there is still a source for atari related items. Having met & purhcased from him on numerous occasions, I found him to be one of the few good resources to help maintain my collection of atari-abilia (CES 2600, 7800, CX800, 800XL, Jaguar, & 3 1040STfm systems).

If you don't have anything constructive to say, then please slither back to the alt.spank.my.ass news groups that you apparently are fond of.

I need some help recovering my data from an old Microscience HH-1050 40M drive. I haven't used my system in several years, due to lack of space, and have recently purchased a new drive system from Ben Smith (thanks, Ben).

I'd like to recover the data, but I think that my adaptec 4070 controller is flaking out. Most of the time, the ICD controller won't see it on the bus, and when it does, it won't detect the drive. I've found the specs to change drive ID's, and that isn't the problem.

I have ordered a new controller from B & C. Will see if that helps

Richard Gordon Faika (rgf) has programmed a utility called eed to help with
this job; it extracts any ASCII text into a file where you can do your
translation thing and it will then "poke" the text back into the binary.

>I'm wondering how CAB "knows" if the .RSC and/or the .HLP file is in

Any chance you have a backup of the Magx.inf file? There is
usually one on the C drive. I would just boot up in regular Tos,
delete the present Magx.inf file and use the backup. Then try the
new version of Aniplayer.

Yes, I use that version also. Works fine, but I do not think there was another upgrade. Would be nice though. I use it with NewsWatch (by the same author) and Okami. Have not ever had a problem with it.

>problems with my Falcon locking up when saving to disk while running
>Screenblaster and Magic. It is running after NVDI and before Magic in my
>auto folder.

Yes Screenblaster is tricky to set up with MagiC.
There's to things you have to do to get it work properly.
The first thing is that you have to put your SBR-files into the AUTO-folder along with the monitor driver, like this:

C:\AUTO\SCREEN*.SBR
C:\AUTO\SCREEN\NEC5FG.SBM

Do use C:\SB_III\SB_MONI.PRG to pinpoint the SBM-files in the AUTO\SCREEN-folder

Do not boot MagiC with the logo-IMG file, thus Screenblaster have to stop the boot to give you a chance to choose/change a resulotion and color depth you want to use. Exclude the rows that present the logotype in the MAGX.INF file.

My old version (the first? and only?) for Screenblaster III do not like a partition with long file names, such as VFAT, so my boot partition uses the 6+3 file system.

I managed once to use Screenblaster with a partition with long filenames, but forgot how. Think I ordered MagiC to start VFAT after the boot through the CPX and not in the MAGX.INF or maybe it was that I told MagiC to boot one app at a time and not several at once? Is this possible?.
Maybe someone here can explain this, to me or you.

Well, I looked into it a bit more, and it appears that when Aniplayer
crashed while saving its INF file, it messed up my C: drive's directory
structure. So it's not just the Magx.inf file, but a number of really
important files and programs have been damaged. Fortunately, the C: drive I
reserve for bootup, OS, and other system-oriented stuff. That I have backup
copies for. If it had happened to my other partition, it may have destroyed
most recently-created documents and files that I would have never been able
to recover. I guess that gives me good reason to grab all my documents and
put them on backup floppies as soon as I get my C: drive put back together!

Yes, they are in the cab.hlp file. Actually all *.hlp files are
missing in the demo version of CAB 2.8 I have. But perhaps the RSC
either issues the calls to the *.hlp, or the object references in
(Derrycks?) translations have changed - though I would have
expected that at most that might call up the wrong text!

> That is what happens here too, I never figured out why.

The bubble help files of Cab and its modules rely on the corresponding
rsc files. There is some sort of checksum issue with the first item in a
dialog where the help text apply, this gives the DialogID. If it doesn't
match - this is what can happen with a raw translation in the hlp file -
you will just see the DialogID and ObjectID. One need a special tool to
compile the help files.

Bye,
/Pascal/

It is, you need to put this line in your MAGX.INF file:

;#_TSL <non-preemptive>

And set Preemptive Multitasking to on in the Timeslice CPX.

Cheers

Derryck

If its been out of use for some while the PSU may be playing up due to the fact that Electrolytic Capacitors don't like not being used. leave it powered up for as long as you're able, you may find it starts working fine after that.

Its possible in my opinion that the SLB's installed by Aniplayer may be the subject of some conflict, have a look throough MAGIX.INF and comment out the Aniplayer SLB's and reboot.

Can you show me a copy of this rule?

There was a informal group enforcement of no commercial posts back in the
80's. Much of the internet was being run on government subsidized computers
that allowed no commercial posts. There was also the .biz hierarchy for them
to use instead of this hierarchy. AFAIK there never was an official rule
against commercial posts but I would welcome the information.

There are rules for some of the newer groups like the programming, binary,
and announce, just for the older groups they never had a charter.

This all changed with the Al Gore legislation that created<sic> the internet
as we now know it.

When is advertising not advertising Steve? Surely I read a mail of
yours recently advertising the Cheshunt Computer Club?

You cant have it both ways Steve.I have never dealt with "Ben" so
have no axe to grind BUT I feel that we should all help each other to
try and keep the Atarian community alive.

Very often we pass details of hardware and software to each
other,tell each other where to find it,even to the extent of giving
commercial firms details. All advertising surely?

Midway, Brisbane and Fremantle.

>On mission startup there's a difficulty setting named 'port repairs only' so
>there must exist some but I never found any.

From page 8 of instruction booklet:

4) PORT REPAIR ONLY
If this level is selected repairs will no longer be accomplished automatically
while in battle or on patrol. Once an item of major equipment is damaged, it
may not be repaired.

You don't "dock" to a port, you just return to it. In the War Patrol scree,
when the screen turn green, you press the right mouse button to end the mission.

Just extract the story dat file from the tos version disk. and copy to a
WinFroz directory on the PC and you have TOS Zork on the PC using the
WinFroz infocom Emulator. Tads are very easy to use on the PC and you still
have the windowed environment. I have done this with Zork I and Zork II but
I don't have Zork III story dat file yet. But back to STeem, once the disks
are set up for insertion as emulated drives it should be a fun experience
for anyone. They are all black and white to me.. text, and more text.
Good Luck
RoyE

There are many freeware programs that can run Infocom data files. These
programs are called "Z-machine interpreters." Here's a site with links to
a bunch, on various platforms:

http://www.csd.uwo.ca/Infocom/interp.html

Try a Web search if you want to find more. You should be able to copy the
data file from your ST copy of Zork (or whatever) onto another system and
run it with the freeware interpreters. I don't have any original ST
Infocom games, but I've got a collection pack on CD-ROM, and I've run
their program files on Linux, Windows, MacOS, and a Psion handheld with
no problems.

Well, *no* graphics on the PC version...so you are safe there.

It is my understanding that the current owners of Zork (Activision)
have released the programs for free. You can download a PC Zork
at:

<http://www.csd.uwo.ca/Infocom/>

They have Zorks I, II, and III...

Due to the length of the Falcon's motherboard, I think a full size
tower (5+ external 5.25" bays) would be a good idea.

I'm pondering how to do a "reverse" installation, where the
motherboard were mounted on the left of the case. This would enable
the cartridge port to be accessable from the top.

Hi,

Still looking for an Atari Falcon 030 in original case with 4MB of ram or more(or the C-Lab released one that looks just like the original Falcon)... plus internal HD. Anything extra is cool!
I would like it to be in very nice condition and obviously working well!
Need to do some direct-to-disk recording and I want to do it on a Falcon like I used to....plus
I got some games I wanna give a go on the sucker! :)

If your not looking for cash, I also have lots of stuff for trade!
Look... :

Sega CD and Genesis with over 40 games!
FZ-10 Panasonic 3DO with 6 games / 2 controllers
Sega CDX (needs minor work with lid closing detection, but works well!)
Sega Saturn with over 25 games (Lightgun, 3D controllers, regular controllers, rental case, the works!)(Near-perfectly Mint Saturn!)
Sega Saturn Plays Imports/Backups
Nintendo 64 with Mario 64 and some games
Tons of Baseball/Basketball/Racing Cards
Zero 5 and some other stuff for the Atari Jaguar
6 Star Trek games for PC
GTA3, Vice City, Freakstyle, Spyhunter for the PS2
PS2 BOXED w/2 controllers & 8MEG Memory Card
NEW DSL (Great if your renting a box?)
I'm sure I have some other interesting items 'lying' around here....

I'll send pics of anything your possibly interested in! Thanks!
Please e-mail me at adistortions@aol.com

Things had been very slack for a long time. Even while Paul was still around.

> I've fond memories of the newsletter they published - very
> professional and useful articles.

I think I only got really interested in what was happening when the Newsletter magically and unexpectedly transformed itself into ST Applications. Articles by Ofir Gal, Vic Lennard, Jon Ellis, Paul Rossitor and Gunter Minnerup (whose TT I'm using now!) were the people that enthused me back then (plus some geezer named Croker IIRC!).

We've got quite more than we know to thank Paul Glover for. Sadly missed...

> It's a pity that ImageCopy hasn't been released with a public key,
> unless the author is still accepting registrations.

I've just been looking through the old CiX conferences (stapplications\imagecopy) to remind myself how incredibly active development was. The last beta upgrade I saw was v4.2b2 before I went AWOl myself. Did that ever go much further?

Jeremy Hughes was also a fantastically helpful character. In my old GDOS days, his Fontkit Plus program was a sign of how exceptional he was as a programmer. I was going to do so much with that program...

<sigh>

Going through the old messages, if those programs had been used by the people giving him feedback he would certainly have supported it. He did loads for adjustments for Magic\TOS (which he had) and Neodesk and Geneva and used to respond to feature & upgrade requests several times daily at one time, even after he became a Mac programmer.

Undoubtedly, Fontkit Plus v4.11 by Jeremy Hughes (who later wrote Imagecopy). Unfortunately it was from the FaST Club, but I don't know whether someone like Nick Harlow @ 16/32 may still have it to sell...

Provided with font converting utilities (from Calamus and Signum) and a font compression utility (Trimfont) it'll do everything you could want.

Yes !

Only MagiC extensions must be set in magic.inf because this SLB are
loaded at start.
If you set Aniplayer SLBs in magic.inf you can buy memory...

974. Help with Atari 1024STF

Newsgroup: comp.sys.atari.st
Date: 2003-02-25 18:55:05 UTC
From: Manfred Georg Kitzbichler <manfred.kitzbichler@uibk.ac.at>
Message-ID: <3E5BBC09.A1C52A21@uibk.ac.at>
Source record: 29154

Hi there!

I recently acquired an Atari 1024STF which had been used at the local university. Unfortunately I don't have a clue how to get it to work since it's my first Atari ever.
When I switch it on nothing much happens, all I get is a plain white screen. I tried to make a TOS disk by using some tools and disk-images from the net but when I insert the disk the computer doesn't respond in any way.
In order to find the possible cause for the machine's rather antisocial behaviour I tried to have a look at its interior. Apparently someone had been tinkering with the poor thing, even though admittedly I don't know what it is actually supposed to look like. Nevertheless I doubt that loose circuit boards and 68881 co-processors piggy-back mounted on the sockets of other chips are the usual Atari Inc. standard.

Anyway, can anybody tell me what to do to get a working computer form this mess ? I could of course tear out everything that looks suspicious to me but even if I make the right choices there will almost certainly remain some jumpers which are not set correctly.
On the other hand if the white screen is just fine and the problem is the lack of software it would be a shame to remove the hardware extension stuff.

So, any suggestions ?

Source record: 29156

Hi folks,

Just wondering if any UK lurkers and regulars have a keyboard and floppy drive for an Atari 520STfm? Got one here that's had An Incident with its keyboard and has been repaired in the past but has since gone bad again (repairable I guess), but it appears that the floppy is toast since it continually tries to seek track 0 and won't read/write even Atari format disks.

Anyone? :)

cheers

Witchy

977. game CDs - request for info

So, where are these "rules" posted. I don't see any rules when I open my news reader. If you want an advertisement free zone, then setup and moderate your own group. It's not like Ben (or anyone else) is still making great sums of money selling Atari stuff. The company doesn't even exist anymore (except as a name on some other company's books).

Besides, it's not like he is spamming the net. Hell, try doing a search on google for atari sales. There aren't many that still activly support us. ICD canceled my order for their Pro HD utilities suite, B&C Computervisions refunded my paypal account because they don't have the controller I had ordered off their web site, and I haven't found many others in the states that have stuff.

Live & let live. Support him or don't, that's your perogative. Just don't post negative, childish crap.

Can it be damaged and not have any ill effects on any files or programs, though? I everything on the C: drive worked properly until I tried saving Aniplayer's INF file, then suddenly very little works properly - I am of course, not implying that it was Aniplayer's fault, just that that's what I happened to be doing when the "Fatal Error" occured.

Yep, that sounds very similar to what happened. Do you know if the new Magic version 6.2 addresses this at all? I'm using 6.01, and was wondering what an upgrade would get me besides $50 less in my wallet. If it solves this problem, it'd be well worth the upgrade!

Hi all

Thanks to the DR(T) for permission and also to Trond (of the
Atari-MIDI forum)for the actual software, I have added the SONG EDIT
MPE to the KCS ver 4 Zip.This really completes this archive as an
official KCS Omega II package.So if you have recently downloaded ver 4
with PVG, go back again to get the whole suite.

http://tamw.atari-users.net/omega.htm

Word of note: if you like the software (and you should!) please pay
the registration fee!! SUPPORT ATARI PROGRAMMERS (past and present)

Thanks!

Tim

> So, any suggestions ?

Well, as you may guess, a white screen isn't what you are supposed to get. An Atari has a basic operating system in ROM, so you should get to the (usually green) desktop if no software is loaded.

The 1040STF has few (if any) jumpers. If you can provide some data as to what was done, we might me able to help. Otherwise, I'd start tearing out stuff.

986. TAMW: Register KCS ver4 and Get The Manual!

Newsgroup: comp.sys.atari.st
Date: 2003-02-26 06:43:22 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0302252243.2b620969@posting.google.com>
Source record: 29166

Hi All

As an incentive to get more registrations for the DR, I offered the idea that if you pay the registration, you get the manual!DR T has agreed.

Details below:

Dr T (Emile Tobenfeld) has agreed to release KCS Omega Ver 4.0 as SHAREWARE.
No registration required.
No support provided.
Shareware fee is $30.00 USD

New: also included with registration is the KCS ver 5 manual in softcopy form (Microsoft WORD)Please note that the manual is for version 5 and will have the additional features of version 5 covered. It can still be used for version 4 with good results.

Send US funds to:

Alpha Channel Productions
15 Frances Road
Lexington MA 02421

Once you have sent the funds, contact emile@foryourhead.com for the manual. Once he has recieved the funds, he will email the DOC file to you.

To upgrade to version 5.0 which includes many more MPE modules, please contact Emile Tobenfeld.Please read the DOCS supplied for more details on version 5.0 . SUPPORT ATARI PROGRAMMERS!!

==========

I have to say that the manual is SUBERB!! Its over 300 pages filled with screen shots, technical as well as practical application. As mentioned it is the manual for ver 5. However it should work fine for ver 4, and give you a taste for version 5.

Lets not disapoint the Dr...please register the shareware KCS ver 4 and you will get the manual: WELL WORTH IT!!

Presumably the people you got it from made the modifications and
therefore would be the best people to ask. You need to know what the
modifications were for what the start up proceedure is as the
modifications may have changed it from the normal boot-up process. Its
possible that they may have disabled or bypassed TOS.

Hi,

as I'm an absolute beginner on the ST, I would like to ask, how I could do batchfiles on an ST.

I would like to use it to display a text message, waiting a few seconds (or user interaction) and starting up a program and all of this should be running after booting the disk automatically (or by clicking on its icon).

Could you explain me, how to do it ?

Thanks

There was a thread about this some time ago, the conclusion was that the SLBs
would be loaded on demand without the need to specify them in the inf file.

Cheers

>any way.

No signs of disk activity? That's one of the first steps the OS goes
through when it starts up. If you get that, it could be that you might need
a driver of some sort for the hardware.

If you can find out something about its history, like was it working when
last used, that might give you a clue.

From your description it could also be that some wires may have come adrift
or perhaps there's some plugin boards that could do with being reseated.

There are no jumpers to be set in this computer, but it is quite possible
that whatever mods were carried out also needed some PCB tracks to be cut.

If it were my machine I would be inclined to try and get it working with
the mods, you would almost certainly have a better machine as a result.

Cheers

Derryck

I can't comment on that, but I would like to point out that a full ENGLISH
version of MagiC 6.20 is available from Atari Workshop, and no doubt from
vendors that AW distribute to.

Cheers

996. Atari Falcon030 Wanted...

Newsgroup: comp.sys.atari.st
Date: 2003-02-26 13:18:00 UTC
From: JagCube@yahoo.com
Message-ID: <83fbea98.0302260518.481ced6d@posting.google.com>
Source record: 29178

Hi,

Still looking for an Atari Falcon 030 in original case with 4MB of ram
or more(or the C-Lab released one that looks just like the original
Falcon)... plus internal HD. Anything extra is cool!
I would like it to be in very nice condition and obviously working
well!
Need to do some direct-to-disk recording and I want to do it on a
Falcon like I used to....plus
I got some games I wanna give a go on the sucker! :)

If your not looking for cash, I also have lots of stuff for trade!
Look... :

Sega CD and Genesis with over 40 games!
FZ-10 Panasonic 3DO with 6 games / 2 controllers
Sega CDX (needs minor work with lid closing detection, but works
well!)
Sega Saturn with over 25 games (Lightgun, 3D controllers, regular
controllers, rental case, the works!)(Near-perfectly Mint Saturn!)
Sega Saturn Plays Imports/Backups
Nintendo 64 with Mario 64 and some games
Tons of Baseball/Basketball/Racing Cards
Zero 5 and some other stuff for the Atari Jaguar
6 Star Trek games for PC
GTA3, Vice City, Freakstyle, Spyhunter for the PS2
PS2 BOXED w/2 controllers & 8MEG Memory Card
NEW DSL (Great if your renting a box?)
I'm sure I have some other interesting items 'lying' around here....

I'll send pics of anything your possibly interested in! Thanks!
Please e-mail me at adistortions@aol.com
Willing to work out a deal of some sort...

Anyone... ? :)

Clint Thompson

997. your interest in additional ct60 features?

Newsgroup: comp.sys.atari.st

Source record: 29179

hi people,

I'm sorry if I'm a little bit offtopic in this group, but I haven't any experiences with newsgroups.

Maybe you know, in original R.Czuba's plan, he would to add to CT60 a PCI and AGP port. After SuperVidel card announcing he wrote me (some weeks ago) he isn't interested in this stuff anymore since SuperVidel, in his opinion, solves everything. My friends-atarists and me can't agree with this, I'll give you some reasons:

1. Deesee card
DSP56300 core is able to use DIRECTLY pci bus, there's no hardware problem to connect it to pci-equipped falcon. And you certainly know, performance is even bigger than 060 cpu (about 100 mips and _more_)

2. ethernet cards
pci gives us a flexible and simple solution how to connect TONS of available (and cheap) eth cards

3. 3D cards
I think, this is clear - 3D card makes about 90% of performance of present PCs. Try to run for example Wolfenstein on 2 ghz CPU without 3D card. Even in the smallest window with everything "off" and "low" it's unplayable! So AGP port open us a door to unlimited world of PC software. It's your card too slow? Buy a new, with 10x more performance for the same money as your old one!

I wrote this arguments to Rodolphe, but it seems he isn't interested in it. What's your opinion? Maybe if we're thinking the same, after massive feedback he could change his state of mind...

OK, that's all, thanks for your patience.

I'd like to add to this...

4. Even with the SuperVidel, with the way technology advances, even that will sooner or later (probably sooner) become obsolete compared to PC cards. I think people need the option to keep moving forward rather than just settle for one solution that works ok for now, but may not be so great in another 2 years, comparatively. A PCI or AGP connector would ensure advancement options.

5. I've always been all for letting people have as many options as possible, because not everyone wants the exact same thing all the time. That's why I use an Atari. It's *not* what everyone else uses. It gives me options to do things a little differently if I want to. That same ideal should apply from within our community as well (IMO). If people want to put in a different kind of graphics card, ethernet card, whatever kind of card,they should be able to. Whether or not that's practical on the hardware/driver/software support provider's side is another story...

I pretty much agree, though I believe that there should be the supervidel
card as well as a PCI adapter. AGP isn't that important though is suppose
it would be nice.

Well, this isn't real mature way to respond but I can understand the underlying frustration behind it too. I hate SPAM, especially in newsgroups but Ben does have a right to post what he wants and you have the equal right to filter/killfile his posts.

Just my 0.02 cents worth.

Where has "SuperVidel" been announced? Haven't seen any posted data
related to that subject.

>
> 1. Deesee card

This would be a nice improvement for some of Apex's processes, even if
only the 56K code just ran a bit faster than on an overclocked 56K.
Otherwise, wouldn't most existing applications have to be recompiled
to take advantage of the new DSP?

>
> 2. ethernet cards
> pci gives us a flexible and simple solution how to connect TONS of
> available (and cheap) eth cards
>

Yes, that would be a nice feature. The SCSI ethernet is slow, and on
accelerated Falcons, can cause SDMA problems.
If one took the time to write drivers, this would be a benifit for CT
060 purchasers.

A 3D FX card would be nice, but has anyone been working on drivers for current PCI cards? For TOS, not many video drivers exist for ISA or PCI cards, and those that do only work for a very specific chip set, generally.
Personally, for my own use, an enhanced Videl is more compatible with Falcon only applications (ie, Apex Media, Rainbow Multimedia). When Videl is not needed, then NOVA-NVDI works fine with CURRENT applications. This is not to say that in the future, 3D processing wouldn't be important if applications were developed to take advantage.

I agree that the addeded benifit of the PCI slot would be a nice feature.
However, for my $280.00 USD, I would just like to get a working card to install my 060 onto, and have it function properly with existing Falcon hardware.

Mike

1006. HTM Files-Yamaha CD R/W

Newsgroup: comp.sys.atari.st
Date: 2003-02-26 22:12:09 UTC
From: swampfax1@atlantic.net
Message-ID: <ZYa7a.11$ft3.5699@newshog.newsread.com>
Source record: 29188

Hi All,
Some HTM files from my Yamaha CD R/W drive are not loading into CAB.
CAB says "prepare formatting" then shows a blank page! View Source shows
the text. If I copy the file from the Yamaha to the hard drive then it
loads ok into CAB from the hard drive.

Note that this is on a single TOS 4.04 Falcon.

Any thoughts?

John G.

Nevermind the rules,

What about the unwritten rules of basic human conduct. Nobody has ever even so much acknowledged the anonymous poster as being "right" or justified. There is however a good number of high profile atarians who think that Ben's behavior is flat out wrong. Most of the advertisements in this group are from where they belong - NONCOMMERCIAL ENTITIES. Being noncommercial they don't have an advertising BUDGET. However if anyone has ever started any sort of business, advertising should always be in the budget. If there's no budget room for advertising, give up. Frankly I'd rather see BS fade into the darkness then endure his endless drivel. I'd rather sacrifice an Atari dealer... I'd rather become a non-profit Atari dealer myself. Why? Because that's the way I feel. Wake up people? Ben is completely ignorant of everyone. I can only recount 1 single response to anyone regarding the huge amount of challenges to his posts, and that post said something along the lines of "I'm mentally challenged". Yet Ben does indeed manage to write well worded essays on why you should shop from him. I think it's a load of shit, everything. I'm so sick and tired of people being incompetent, not because they really can't do something, but because they are lazy and make silly excuses. And excuses are all that I think is going on.

Fact: if ben can maintain the website, maintain the catalog, write essays, carry (sometimes large) boxes to the post office to ship and do things like that, he could also do MANY other things to supplement his income. It means he should play by the rules and at very least respond to people questioning his practices. I mean after all, as an Atari retailer, how busy could he be?

This all just bothers me on so many levels. I HATE it when people say they CAN'T do something... it's crap.

Mark
http://atari-source.com

PS: my opinion may be blunt or unfavorable but understand I'm the type of person who must have something proven to him before he believes it. I don't believe ben has a mental disability because nothing of any sort has been said to prove it, however I do believe Ben is an ignorant ass and he has certainly proven that. How can you challenge that? Wah wah, he's one of few. Who cares? It's a business and if one business advertises here then every small software developer and commercial entity should be allowed to advertise here. That's the rules right? Atari may be small but don't you think this newsgroup would become rather unreadable rather quickly right?
The fact remains, there's so many more forums and even BETTER ways for him to advertise in this one. Ben chooses not to so why shouldn't we bitch?

Thats not the same league, the Cheshunt Computer Club is an informal non commercial meeting of Atari Users, the very thing that should be encouraged.

> You cant have it both ways Steve.I have never dealt with "Ben" so
> have no axe to grind BUT I feel that we should all help each other to

Having had a quick nose round the site that depends :) I was more
after someone who had a trashed ST that had a working floppy drive
that they'd let go for a couple of quid - the keyboard I can fix since
the problem is only a broken track or two....the company I worked for
went into liquidation a few weeks ago so it's not like I haven't got
the time to trace the tracks and this keyboard's already been fixed
once.

If you could do me such floppy wonders that'd be great :o)

cheers

Power supply is a fairly new AT 300W power supply, and it's working
fine.

Combinations I've recently tried:
2 ICD SCSI Plus cards (1 for my 400M drives, one for the adaptec
4070).
1 ICD card connected to the 4070 (swapped both cards into this
configuration).

2 ICD cards (see above), 4070 attached to a working? TM502 12M drive.

Problem is, the 4070 doesn't always report any devices on it.
Sometimes, the 4070 doesn't even come up. I've tried 3 different
power supplies (1 from a working 486 I had, 1 from Bravo Sierra that I

bought with my 400M drives, 1 600w custom supply I borrowed from work).

I'm currently scouring the net for a local (USA) source for another 4070, but most of the sites that Google brings up either don't have any (contraty to their price list), or are trying to charge double what they advertise. I only want to recover the data and transfer it to my 400M drives. After that, the drive will probably end up being a target at the shooting range (40M drive vs .357 magnum - cool).

1016. [UPD] March Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-02-27 10:45:58 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <3E5DEC66.8050101@lutece.net>
Source record: 29098

Hi all,

My software "Eureka" is updated and released on its WEB site.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.lutece.net/eurka303.zip
That is the Complete Common Edition

http://eureka.lutece.net/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.lutece.net/eurka020.zip
Is the Complete 68020 Edition

http://eureka.lutece.net/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.lutece.net/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.lutece.net/tiny044.zip
Is the OpenGL Extension (requires previous package)

It seems that our ATARI.ORG portal is not working those
days. That's why I didn't gave you the redirected links.

I wish you big fun with all this new STuff !

Best regards,

-- François LE COAT

Just a side note, rtl8139 based network cards (that are the 'TONS' you are speaking of) require busmaster DMA to work. So the PCI bus adapter must implement this (this is for example not the case for the already available Falcon PCI adapter).

Most modern PCI cards require busmaster access to main memory, so a PCI
adapter without that feature is very limited in use.

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. Can any experts out help out with this...?

I have a friend who is trying to recover a large amount of music made with the help of an Atari STF. I'm not sure if I'm communicating all the details but as far as I can tell the problem is that Steinbert Pro-24 v1 is going out of synch with a timecode device that is driving a tape. He's been advised that this is something to do with the dongle and if he can replace it it may fix the problem...

any help, pointers to generous experts, kind advice etc will be received with huge gratitiude...

If you identified a 68881 FPU it is probably mounted on top of the CPU- that could be the most logical place because it uses almost the complete CPU bus. As far as I know in any variant of the 68881 add-on it does not require any traces to be cut- the coprocessor board should just sit on the bus parallel to everything else- and therefore can be safely removed if you like it so. On a more gentle approach, removing the -AS signal leading to the FPU board and tying the FPU-board side of that to +5V should completely disable the FPU- unless it is badly malfunctioning.

Btw. if the FPU is -ABOVE- the MC68000 CPU it could mean a cooling problem for the CPU; ventilation in a 1004 is not very good (no fan).

>Anyway, can anybody tell me what to do to get a working computer form
>this mess ?

You should check that ROM/EPROM chips are in their sockets; there should be either 2 ROMs or 6 27C256 EPROMs- unless they tried to install TOS 2.06 in which case there should be two 27C010 or 27C1001 EPROMs. It could be a good idea to press a little the EPROMs (and all other non-soldered) chips into their sockets (so that they move just a little bit)- after many years pin contacts tend to become bad.

Also check that the floppy drive is connected properly. If the computer is near to functional there should be some floppy activity very soon after power-on. But beware: unless there is some floppy in the drive, the computer takes more than one minute to show desktop on the screen. With -ANY- MS-DOS formatted 720KB floppy in the drive, it comes to life after several seconds.

A few ...

The most notable was the development of the Falcon030 and a handful of
low volume compatibles (Medusa, Hades, Milan). Multitasking and a
Linux-like OS (MiNT) now exist, as do a variety of adapters (Ethernet,
IDE) and drivers (for CDRW, etc.). Adapters and drivers are now the
main concern since USB and PCI are still not (mostly) available to us.

Galen

Seconded, although there are others such as Mega Depack, Multi Depack,
Naughty Depack....

However the best boot manager for the Falcon is Stoop. This, unlike XBoot,
has Falcon specific features....

1043. Porthos 3.20 released

Newsgroup: comp.sys.atari.st

From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3e60cbf3.0@entanet>
Source record: 29125

I've just downloaded the newly released Porthos 3.20. You can also read a bit about it on ST-Computer.

I've just put quite a lot of PDF files through this version and it does display quite a lot of documents that the previous version couldn't. Noteably the font problem has gone and a lot of images that didn't render before now do so (eg. Kingston RAM pdf's).

I still have a few files that this version couldn't display properly and a few pdf's that the previous version could display but now cause Porthos problems. Also, I had some stable problems and Porthos crashed while trying to display a few files. However, I re-booted and I was able to display some of them but not all.

Overall, the display looks better and for most pdf's don't seem to be much slower (Milan060). Files with tables in them do seem to be slower but this is all subjective as I haven't done timings.

Thanks Wolfgang.

I've just tried it to. First I was disappointed: I got a crash with an
"ILLEGAL INSTRUCTION" error message. But I suspect XaAES of being
responsible for that. Under N_AES it seems to work quite well. Maybe Henk
Robbers is willing to take a look at it, if other XaAES users experience
the same error ?

Hello,

That happened to me when I got an 1040 from a friend. I got it
working by opening it up and pressing down on all the chips
(especially the RAM chips). Hopefully your problem will be that
simple...

Yes, backing up is important. I use CDBackup from Anodyne and
backup my partitions to a CD. I usually keep two copies that are
usually 2-3 weeks apart...

1050. nameless file problem

Newsgroup: comp.sys.atari.st
Date: 2003-03-02 09:19:50 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0303021008010.181-100000@easymint>
Source record: 29132

I have a strange problem. When I was playing around with GfaBasic I accidently created a file on my harddisk with an empty name, or maybe a name with only spaces - I can't really see. In my fileselector I see an empty line and on my desktop I can see a file icon. It also has a size so it is really there. But I can not delete nor rename the file. Also I cannot delete the folder that is around it for that reason. I have tried with the standard single TOS desktop, I have tried under MiNT using bash and the rm and rmdir commands, as well as actions under THiNG - no luck. I also tried HP-optimizer's logical check to see if this would fix anything. No luck either.

Does anyone have any idea how to get rid of this ghostfile ?

Martin Tarenskeen

1051. [CT60] hard update with the falcon

Newsgroup: comp.sys.atari.st
Date: 2003-03-02 10:42:04 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1fr6ys1.lktlc7e5k6kuN%NOSPAMS@wanadoo.fr>
Source record: 29133

Hi,

This is the latest news about CT60 software package, now in the archive
http://didier.mequignon.free.fr/files/ct60_404.lzh (1,25 MB)
there are a new version of Flash Tool CT60 v1.1 (sources are inside):

The main task of this program is to put TOS binary (.BIN) files inside
the flash, but the second task is to update the CT60 hardware !!!! with
two jedec files (.JED) for ABE60 et SDR60 chips (XILINX XC95144XL CPLD).

- You need to make the cable for the JTAG CT60 connector linked to //
port,there are a schema.pdf inside the archive, but you must replace the
SELECT/ pin 13 on the // port by the ACK/ pin 10.

- Normally the cable must be attached and powered (by the CT60) for
proper verification. Only SDR60 can only programmed (or verified) when
the CT60 is connected to the mother board in normal 030 mode (if you use
the same machine CT60/F030 ;-)). If you update the ABE60 chip you need
to remove the CT60 from the bus.

- If you load the good jedec files, another button appears 'verify'. You
can use this button for compare the jedec file with the chip. The
'program' button erase, program, and verify his flash.

I can update this program for the future Super Videl.

Regards,

Didier.

You'll need a command line interpreter, if you find one of them it'll
usually have a help file detailing commands and syntax.

Source record: 29142

Hello,

My paper (letter - 8.5 x 11) is not advancing past the tray of the
printer.
(paper jam error - paper is slightly advanced but still in the tray)
I tried a lighter weight paper. Same error.
I changed setting on tray (upper right corner) to letter size.
Though I don't think it matters, because I am pretty sure I have an
A4 tray. Same error.

Does anyone know why the paper is not being drawn into the printer?

Is it possible to clean a smudge off of the green drum?

(I can see the smudge on the drum, which shows up in the center of
the printed page.)

Thanks in advance for any suggestions.

ken

Your problem seems to be the same as I had quite some time ago. For some reason Wensuite Browser (not the latest one) created a host dir (no name) when I started it up for the very first time. I found out I could delete this dir with Diskus. There is a demo on the Belgian ftp-server:

<URL:ftp://chapelie.rma.ac.be/atari/utilities/disktools/diskus39_demo.zip>

Did the paper feed problem just start?

A couple things come to mind, rollers getting hard and losing their ability to move the paper, or weak springs pushing the paper up against the rollers.

I don't know about cleaning hte smudge off.

Hallo Martin!

MT>Does anyone have any idea how to get rid of this ghostfile ?

As it's located inside a directory, simply use Kobold to delete that directory.
Kobold doesn't care what's inside directories. It might even be possible to
rename the file.

mit freundlichem Gruï¿½ aus Bubenreuth

Hi Martin,
What system are you using? If it's a Falcon booted with ICD then
Cleanup program should be good. An oldie called Unhide may work also. If
you boot with HDDriver then maby Diskus will do.

John G.

1070. Super Videl CT60 Graphics Card

Newsgroup: comp.sys.atari.st
Date: 2003-03-02 20:18:14 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1046611150-822368AEicMi@williams-net.com>
Source record: 29049

Anyone,
For those wishing to put there name on a list for
the CT60 Super Videl Graphics Card. One should visit
this web-site:

http://www.dtek.chalmers.se/~d98gilda/

And click on Hencox or Instreams link which should be
there e-mail address to send ones interest directly to
the developer.

I have been in contact with one of the guys since last
fall and it sound VERY promising. So far I know that
they plan on making it a 64 meg DDR SDRam Graphic
Card. With all the normal video resolutions supported
but also they plan to go clear up to 1600x1200x30bit
resolution. And all of this can be done on the fly
without rebooting, like is necessary with the Eclipse.
Many other features maybe added later on, once FULL
Videl compatibility is insured. Some examples
include:

1) MPEG decoding built into the FPGA
2) 3D polygon drawing/Texture mapping
3) And Super Blitter.

Plus who knows there maybe other features as well, all
depends on the amount of room in the FPGA itself. So
visit the web-site for more detailed plans of what is
going on and the status of this project. I know that
they are close to completion of the programming of the
FPGA somewhere in the region of 60 to 70 percent.
This does not mean that the project is complete.
There is many other steps that are needed. Like
designing the board itself. BUT, one of them has
started this, so that is promising as well.

Thanks,
Carey Christenson

Surely MPEG decoding would involve expensive licensing and hardware testing
and certification?.

Hello Steve,
This may or may not be true, but surely the
licensing companies are more worried about getting
there money from Apple and Microsoft rather than a
small group of Atarians such as us. I have also heard
that this Graphic Card maybe adapted to other
computers as well. Such as the Coldfire project and
who knows maybe even the Hades and the Milan.

Thanks,
Carey Christenson

1075. AtarICQ 0.156 is released

Newsgroup: comp.sys.atari.st
Date: 2003-03-02 23:46:27 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.speecgre@localhost>
Source record: 29055

Hi all,

After a period of intense bughunting, there is now a new release of the AtarICQ available. Most noticably the following fixes and additions have been made:

* Bug #1 fixed: Buffer overflow (1 byte)
* Bug #2 fixed: A nasty bug caused by a mixup of real and virtual memory blocks (caused memory leaks/data corruption) * Bug #3 fixed: Memory leak, causing aICQ to waste some RAM every time ataricq.udb was saved to disk * New shortcut: CTRL+h will tell AVSERVER to view the logfile for the active contact (requires "instant history" enabled) * Introduced a scheme for embedding command codes inside text buffers. As a result of this, it is now possible to use more than one text colour in the text * Following the above, it is possible to config the colours of message headers in preferences * aICQ will now detect URLs hidden inside "brackets" like ()[]{} * Arrow-down key should move cursor to end of line below, even if that is to the left of current cursor position

-In other words, if previous aICQ release introduced stability issues on your setup you should definitely give this one a go!

URL: http://www.ataricq.org

Regards,

Joakim

>John G.

Did you try HP-Optimizer in optimizing mode? Make a backup first!
That should get rid of the blank file - I take it you don't need
its contents.

Alternatively, can the folder containing the offending file be
copied? If so, then copy the whole partition elsewhere you have
enough room (into a folder labeled with the drivename, say), zero
the original partition (which wipes the FATs) and then copy the
contents of the folder back to it, finally deleting the copy. This
will also defragment the newly copied partition!

If you have Egale, it's worth using the Tree check facility each
time you do the batch copy, to make sure that all the files have
been copied uncorrupted.

Regards, /Peter/

correct, the D rollers in the cassette feeder do become worn or coated in paper dust prohibiting them from getting any grip on the paper to feed it through.

As for the drum, fee free to clean it with any lint free cloth, that's not abrasive. do not use any liquid on it either. This is assuming that the smudge on the drum is caused by an oil deposit from your fingers or some other harmless deposit.

If the mark is still there, after cleaning, its a good chance the wiper blade in the drum kit needs to be replaced. They are available new at special request from certain toner remanufacturing suppliers or you can simply replace the piece of rubber on yours if your feeling handy.

Hi Jim & Newsgroup,

Thanks for your suggestions. I cleaned paper paths, rollers and
press roller (back cover under metal spring).
I also turned felt strip over. (cleaning pad)
I tried a couple of tests. It seems to be working better, though
still jams. Not as much though.
There were a lot of rubber belts. My guess is that one or more
of these are stretched.

> As to the drum smudge, one of the things I have done to mine that has
> caused no problem is to wipe such stuff off with a ball of cotton.

The drum smudge was real bad. There was some sort of debris which
put a streak right in the center of the drum.
I managed to get most of it out using cotton.
It is much better.

> But, where might one get a A4 tray? I could use one.

My tray has the following slots for the plastic divider.
B5 LTR A4 LGL

Eventhough I have an A4 slot, the manual says I cannot use
B5 or A4 paper.
It doesn't really say why.

Not sure where you could find a tray like this.

ken

Hi folks

I've a load of Atari magazines and cover disks and they've been taking up a fair bit of valuable room in my place for some years. I'm happy to let them go to someone who may find them of use. I've loads of copies (in binders for the most part) of ST Format, ST Review and ST User and their accompanying coverdisks. I was a STF subscriber for a while and so have the wonderdisks for those issues that were only given to subs holders.

All mags and disks are in very good condition and I'm happy to let the disks go in the diskboxes they are stored in.

I also have all the issues of the short-lived Atari World plus disks. If anyone is interested please get in touch. I am not looking to make a killing with this stuff, just some room!

Cheers

I have had this problem where I have a file that I cannot get rid
of. What I did was to copy all other files to another partition
and just re-initialize the partition with the bad file (using
HDDriver) and then copy all the other files back. Takes awhile,
but works. You could also try something like HD-Sentry (in TOS
mode) and see if that helps.

>Is it possible to up the refresh rate on the TT 030 or is it stuck at 60Hz?

I would think it would be possible to adjust that if you are using
a graphics card and if that graphic card's driver had that ability
to change it. On my Hades, I can change the refresh rate just be
using the driver to my graphics card.

yes...for CT60 we need PCI & AGP slots...
With PCI we will opened door to: TV card, ADSL card (or ISDN),
Ethernet, Deesee, SCSI or IDE card, and other...

I want PCI & AGP for my CT60....hey Rodolphe!....please...

In my opinion, SuperVidel is a great opportunity (100% Videl compatibility)
but at least PCI is somehow _ESSENTIAL_, and will open many ways that are
now unavialible.

You can try http://perso.wanadoo.fr/didierm/files/pic_dev.zip
but you need a 68020 or more (tested under falcon).
Inside the archive there are gputils (assembler) and prog84
(programmer).
I use this tools for the Eiffeil card (PIC16F876 but all is good for a
16F84).

Source record: 29085

Thanks all for the reactions.

I finally got rid of the file.

First I tried Kobold. Didn't work. Doesn't work very well on my system anyway, that's why I never use it anymore lately. (I keep getting these messages telling me that my computer doesn't have enough memory. But 14+32 MB should be enough, right ?)

Then I tried the DISKUS demo, which looks like a very good program. But the functions that I needed were not active in the demo version. Maybe I will buy it one of these days, my German is good enough to understand the program and it's documentation. I hear some people say "if you use HDDRIVER ...". My impression is that it has nothing to do with HDDRIVER. It is a good program even if you don't use HDDRIVER. Correct me if I'm wrong. On the other hand, a program like EDGE will give problems with modern filesystems (Long filenames, big partitions) that DISKUS can handle without problems. But DISKUS can also still handle old fashioned TOS partitions, right ?

Back to my problem:
Both the file itself and the folder around the invisible file could not be deleted.

This is what I did: I moved all the normal files in the directory to another location. Then I created a new file in the directory named "X9876543.210". Then I took a disk editor (DADE, from EDGE 2), and used the "find" function to search for the string "X9876543210". After quite some waiting, this brought me to the subdirectory sector where I could identify the problematic empty file-name. I then replaced the first byte "X" of the empty filename with E5(hexadecimal) - the file was now recognized as "deleted" and I could delete the folder on my desktop again.

Source record: 29087

I recently started going through my old ST PD/shareware game disks, only to find that some of them have gone bad. Some of the titles I lost seem to be extremely rare, I can't find them anywhere on the net. The Crawly Crypt CDs list a couple of them, but the links are broken.

Anyway the games I'm looking for are:

Insecta (not insect or insects)
Lunar Lander (it might have been called just "Lander", but it was based on the arcade game)
Megapede
Punkman
Smasher
Tempest (I'm not sure if it was called tempest or just based on Tempest)

If anyone can point me to them or send them to me, I'd appreciate it.
Either reply here or at tony <dot> smolar <at> verizon <dot> net

Thank You

DISKUS (http:/www.seimet.de/diskus_english.html) works with any hard
disk driver. Drivers that support the SCSI Driver interface are best,
however, as only these drives give you access to full functionality of
DISKUS. DISKUS is available in a German version with a German manual only.

Yes, it can, but it *cannot* handle long filenames or FAT32 partition.
You can access and work with VFAT partitions that have long filenames,
but you will lose the long name as soon as you use the filename-related
operations of DISKUS.

I'm speculating here, but I wonder if it has to do with the printer driver.

You move the tab to switch between legal and letter size. I wonder, if you had a European machine with appropriate drivers and language in the computer, if you did the same thing to switch between B5 and A4. Then the only difference between the printers you sold around the world would be the voltage power supplies. Cheaper.

Ed,

I think you are right, but a standard graphics card such as we have in our Hades will not work in a TT. There are no expansion slots for the card. There is a VME expansion slot, and there were a few cards made that fit here. One is by Cyrel, and I have that one installed in my TT, although I haven't run color in years. Crazy Dots was another card. These cards completely bypass the built-in monitor connector.

>It seems that battery in my Falcon is going to die. I'd like to replace it,

You need to change the NVRAM chip, which also contains the clock and
battery.

A suitable replacement is Dallas DS12887, Maxim are the folks whose web site
will pay you to visit if you <cough> need a sample.

>but I'm yet unable to find it over the board. Where it may be? (Board is

Big chip under the keyboard - you'll need to take the shielding off to see
it (and take the motherboard out to change it).

Cheers

Derryck

Oh my gode! (pj)
Silly me, I didn't think to have a look on the author's site.
Thanx for the tip, it will help a lot the guy who asked me at least an
English version (I cannot produce a French one atm).

> Don't forget to thank DDP Translations for this translation ;-)

Of course I do :-). Almost all your team/group replied to my request.
Thank you all.

Best regards!
/Pascal/

Sure but ... on Had�s and Milan are PCI slots but we can't use those great ultrafast 3d cards simply because about all vendors don't offer docs to make drivers !

I know a good programmer (Patrice Mandin, French) that seem to be ready to do something to cure that, but he was looking for a b�tatester with a 3dfx and a Tos compatible with PCI slots ... and didn't found any.
Maybe I will try to cure that.

It's the Dallas Semiconductor chip.

Visit http://www.maxim-ic.com/

Enter the code number off the chip into the search box, it should give you a result.

If they have the correct chip, you can request free samples. They will send you two of each chip you request. When you fill in the form, pretend you work in electronics or something to a degree. Somone on this group told me about these people, they are excellent. I requested lots of chips in the past, and even saved ?30 by replacing the dead NVRAM in my Sparc with a sample chip.

By the way, a sample chip is exactly the same. It just means they are not guranteed the whole lifetime. But they are free.

Hope this helps

Simon

It should be an NVRAM Real-time-clock. I don't have a falcon any more so I
can't remember the chip number, sorry.

GFX cards do not have highest priority for me. Network cards have. Being
connected means being alive those days.

The main problems is that PCI vendors on our platform never showed much care
to provide drivers. Look on Amiga world: their situation is much better, the
have really much hardware to choose and plug into their PCI bridges becouse
vendors make drivers.

Can someone list drivers that were provided by PCI bridges (and clones with
PCI/ISA) vendors?

1126. Amiga Coldfire project

Newsgroup: comp.sys.atari.st
Date: 2003-03-05 21:56:51 UTC
From: LS <lannie@me.com>
Message-ID: <cd2568b072dee0d78d45e78fb79757f5@news.teranews.com>
Source record: 29007

I was searching for the Atari Coldfire project and found this site:

http://www.cdtv.org.uk/coldfire/index.html

I wonder what would happen if these two teams could team up together and take advantage of each other's designs, codes and expense in making prototype boards and etc. This could decrease the cost of the upgrades for both platforms.

Any thoughts, ideas?

Lannie

PS Amiga and Atari working together for the benefit of both makes sense.

I had a Cyrel for about a week, promptly returned it. At the time I bought
it the mode selection and setup really messy. Way more complicated than it
should of been, also it refused to work on my TT with the cpu cache enabled.
Perhaps these problems were address later. I had a Nova and currently a
CrazyDots II, both of which are fully programmable. It all depends on the
monitor you have, how high you can push it.

Hi, Martin!

MT> This is what I did: [...]

My suggestion would have been a similar: Use a disc monitor, seek to the directory's sector and edit the file's name entry manually!

Your ghost file was not an empty one, as I remember?

So you should have given it a name to remove it properly. By marking its directory entry as empty ($E5) you did not free its data clusters!

My favorite disc monitor is SED (Bookware, comes with the german book "Scheibenkleister II" (C.Brod, A.Stepper) which deals with all kind of mass storage for computers).

It has functions for finding a directory's cluster and (much more interesting in your case) for gathering orphaned clusters.

Though there has been further development on SED I am not sure wether it supports vfat or fat32 in its advanced functions. If you stay on the physical level you may find it as useful as your "DADE" even for these file systems.

Google search for "atari sed" finds:
<http://www.geocities.com/SiliconValley/3366/atari.html>
(homepage of C.Brod)

Regards,

Alexander

I looked at the site, it appears to be a card only, not a motherboard.
I'd prefer a motherboard versus a new cpu sitting on top a slow bus. It's a nice idea to cooperate but I don't think this particular project is similar enough.

1135. Does a program like this exist?

Newsgroup: comp.sys.atari.st
Date: 2003-03-06 06:00:29 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <BA8C32A4.2BA32%nameerf@flash.net>
Source record: 29016

Hello!

I was wondering, does anyone know of a program, preferably one that runs from a TSR, ACC, and/or CPX, that can monitor a specific folder, and when an IMG file is dropped into it, automatically print that image through whatever GDOS/NVDI printer you have set?

My reasoning: I'm still frustrated with the fact that Cubase won't print because it doesn't support my printer. It can, however, print IMG files in whatever folder you assign them to. Right now, I have to print them to an IMG file, quit, run Papyrus, center everything on the page, then print. And for multiple-page printouts, I have to reload it into Papyrus, center it again, and print again for each page. Then, if I notice something I need to change, I have to reverse everything, go back to Cubase, make the changes, then go through the process again. If I could simply have some kind of TSR, ACC, CPX, or whatever would work in single-tasking, monitoring a folder, and automatically print when it sees a file is saved (and closed by its parent program), it would be the next best thing to having new printer drivers for Cubase! The program could then delete the files (or send them to an archive folder), so it doesn't get confused by old files.

This would be beneficial for people like me who find themselves stuck in a situation where the available drivers don't work. This can happen in Cubase, PageStream, ImageCopy, and lots of other programs that have their own drivers and don't support printing through GDOS or NVDI.

Any ideas if this program exists? If not, anyone want to take a shot at it? :)

I was under the impression that the actual chip is long since obsolete - the chip I suggested is a suitable replacement (I asked about this over in c.s.a.st, since a fellow club member requiered a replacement. He chickened out of it in the end!).

Maxim have a UK base.

Cheers

The gemulator works well with the 'normal' mouse, like under windows. But I hardly ever use it, instead I use the cordless / wireless mouse that is supplied with the Wacom tablet (and the cordless pen). The 'feel' and handling are quit different and I prefer using the cordless one... I even have trouble using the normal mouse.
But the Wacom one is not recognized bij Gemulator's hard- and software. That why I hope'd there would be something like an ACC or CPX thaat could help me with this problem.

1144. Trying to get STiNG operating again...

Newsgroup: comp.sys.atari.st
Date: 2003-03-07 00:38:39 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <BA8D38BA.2BA58%nameerf@flash.net>
Source record: 29026

Hello!

After much happiness with MagicNet, I'm going to have to move back to STiNG for a while, because I am getting a SCSI/Link-3 Ethernet adapter (my only really feasible Ethernet option), and they don't make a MagicNet version (yet?).

Problem: Ever since my ISP was bought out (for the second time), STiNG refuses to move past the "Initialising Link" phase. The odd thing is, my file settings are identical (other than necessary syntax differences) to settings I use with MagicNet and STiK2. Both of these connect fine. I remember this "Initialising Link" thing being a problem in the past, but trying everything that was suggested in past posts didn't help. I'm baffled by this one. Any ideas? Thanks!

1145. Game Title?

Newsgroup: comp.sys.atari.st
Date: 2003-03-07 01:39:05 UTC
From: justisaur@netscape.net
Message-ID: <a40fb5d0.0303061739.7a50d3e1@posting.google.com>
Source record: 29027

I used to have this game on my Atari ST (no longer have game or ST), I can't remember the title, and after hours of googling, I thought I'd ask here if anyone knows what it is?

It was kind of a bard's tale like adventure, first person wandering around set squares. You played a robot, and got upgrades to your parts, eventually getting these cool irridecent green & blue bug looking parts, you also got weapons like machine guns. There were these damn codelocks all over you had to unlock as well. You advanced by traveling to different plannets, where you found more underground areas. There were also dinosaurs wandering around on the planet's surfaces.

All the searches I did for robots came up with stuff like "Escape from the planet of the Robots", "Xylobot" (cool game), and Bard's tale robots so you can play Bard's tale without actually playing it (no idea why you'd want to do that). None of These are it.

Hi guys' just thought you might like to know, got some Atari kit from 16/32 systems in England. Nick's service was brilliant, the stuff got here (Melbourne) in less than a week in perfect condition. Awsome stuff. I have to say Nick is probably the most diligent Atari vendor I have come accross. He actually got some Falcon titles released that otherwise wouldn't have seen the the light of day. I will be getting more in the future. Now back to the Grand Prix;-)

This crude offering highlights the bare essentials...

```
#!/bin/sh
CWD=`pwd`
SRC="aranym-0.7.0"
cd "$SRC/src/Unix"
./configure --help >"$CWD/hlp.log"
./configure || {
echo "-ERR: drat (hint: $SRC/src/Unix/config.log)"
exit `false`
}
make || exit `false`
echo "+OKI"
```

...assuming that the src archive was unpacked within CWD and created the SRC subdirectory: alter SRC accordingly.

If there's no 'configure' at all then the short answer is you likely grabbed the wrong sources. Long answer commences with phrases like 'autogen.sh', "autotools", "synaptic failure" - "trip to dentist to have all teeth removed without anesthestic (because it's more pleasurable)".

Hope that helps.

I read in a MyAtari article that STiK2 doesn't support CHAP, either, and it
works just fine on my ISP. Also, doesn't CHAP *not* use a login script to ID
its users, as it's point is encrypted login? My ISP requires a standard
login script. STiNG gets through that just fine. It's what happens after
that that's the problem.

1154. SLM804 for sale, cheap

Newsgroup: comp.sys.atari.st
Date: 2003-03-07 19:42:19 UTC
From: Joseph Hogan <hoganj@freenet.msp.mn.us>
Message-ID: <070320031444598792%hoganj@freenet.msp.mn.us>
Source record: 29036

I have an Atari SLM804 laser printer to almost give away. I got it when I picked up other Atari software and another monitor.

I would ask maybe $5 plus price of shipping for the printer. This is negociable! It comes with the cable to hook it up to the computer.

I am in Montreal, Canada, and I am willing to ship it anywhere, assuming it is paid for before shipping.

Write me to my e-mail, as I don;t frequent the newsgroup too often.

Let me know, as I want this to go to a good home.

create the RPM package by yourself - simply run

rpmbuild -tb aranym-0.7.0.tar.gz

then install it as any other RPM, rpm -i aranym-*.rpm

Petr

P.S. I'll upload the RPM in a while.

Hello,

Tell your friend to get an ICD Link 2 host adapter. Then he should
be able to use most any SCSI harr drive. Also have him get
HDDriver as the driver for the hard drive. I have such a setup on
my STe and it works great...

>PS Amiga and Atari working together for the benefit of both makes sense.

Well I would think that would be a great idea. Would be nice to
have a nice updated computer that would run both Amiga and Atari
programs at once. I am not sure if that would happen, but I would
buy one if it ever came out.

I have the same problem with the newest version of STING. I have
not solved it yet, but I am working on it. I have MagicNet on my
Hades and it works great, but I want to get my STe online and
using STING is the only option.

LS

There is a new version available on my homepage.

Among many small improvements:

Dynamicly configurable menu shortcuts
Proper handling of drive u:
An up to date hypertext
Printing of directory listing
Floppy formatting and copying
Improvement of Delete via menu
Dialogues fit in ST low
Shutdown
Resolution switching (if possible)

Please reply to rdf0013@earthlink.net

Thanks,
James

Things I am looking for in trade:

LCD monitors
Gameboy advanced system
Neogeo Pocket system
Firewire HUB
USB cameras
X10 devices
portable mp3 players
Gemulator rom card

If you are interested please email me with a list of things you do
have for trade or if you would like to buy, just email me
and I will send you a list with what I am asking for the items.
If you have items for trade not listed above, please send list and we
may be able to work out something...

Things I have for sell or trade:

* Gateway solo 9300 specs: (has problems, might be easily fixed)
-PIII 600
-196mb ram
-10gb hard drive
-1024x768 active matrix screen 14.1"
-CD rom
-Floppy
-IR port
-Firewire port
-2 usb ports
-2 pc card slots
-ps/2 port for external mouse & keyboard
-digital spdif out
-composite video out
-Composite video in (for video capture or watching tv/movies)
+56k modem (pc card ï¿½ 3com w/xjack)
+10mb Xircom pc card nic w/adapter
+driver CD
+AC power adapter/chargers
+Windows98 with Eula preloaded.

* Atari arcade upright showcase cabinet (SN#152) with sub woofer, speakers, coin door and coin box. Can be made into a Mame cabinet or I have several arcade mother boards that can be mounted in it as well.
+For a Mame cabinet I will throw in the following items with the cabinet:(all working)
-Intel PIII 700
-Asus P3bf motherboard w/AGP
-128mb ram
-Sound Blaster PCI sound card
-Matrox MGA PCI video card (not the best, but its free with the deal)
-21" Viewsonic monitor
-8 way Joysticks
-Buttons and cherry switches (multi colors)
-Arcade power supply for lights
-Cable for wire harness
-PIII power supply
-32x max IDE CDrom drive

* Arcade Motherboards: (all worked when I pulled them from cabinets)
Star Castle
Vindicators (plus audio board)
Captain Commando / Knights of the Round (one motherboard and two daughter boards)
Time Soldiers (with special controllers)
Super Street Fighter 2 (plus audio board)

* Sony Playstation with MOD chip, 1 controllers, 2 memory cards, gameshark pack, all cables and 95+ games and backups

* Nintendo64 system with controller, all cables, system memory expansion, 2 memory packs, controller carry case, 4 games

(Southpark, Super Mario64, Mortal Kombat Trilogy & Star Wars Shadows of the Empire)

* SNES system with Jap<>US adapter, all cables, 2 controllers, 4 games (Ranma 1/2 Jap rpg, Mechwarrior, Super Mario World & Ranma 1/2 hard battles)

* Panasonic 3DO development system (has switch on back to encrypt/decrypt, like MOD chip to play copied games) with 2 controllers, all cables, 20 Anime/Jap/US games (Shock Wave, Shanghai, Plumbers don't wear ties, Policenauts, Starblade, 3DO sampler, Night trap, Way of the Warrior, Strahl, Graduation, Belzerion, Powers Kingdom, Takeru,Virtual Puppet Reika, Nice Body, etc...)

* 2 Sega Genesis (new model & old model), Sega CD rom, 2 Controllers, Composite video cable, controller extension cable, 1 game (sonic the Hedgehog)

* 2 Sega gamegear, Sega Gamegear<>SMS adapter, Sega Link Cable, TV Tuner Module, Rechargable Battery Pack, Handy Gear case,

gamegear storage case, cartridge cleaning kit, Sega Master System
games (Trans Bot, Great Football, Space Gun, Heroes of the
Lance, Global Defense, Assault City, Hang On / Safari Hunt), Sega
Gamegear games (Chicago Syndicat, Beavis and Butthead,
Sports Trivia, Super Columns, Sonic the Hedgehog 2)

* Sega Nomad, AA battery module, 1 game (Shadow of the Beast)

* HP DAT 4gb scsi dat tape drive with Adaptec 2930 Ultra scsi card and
cable

* Zip 250 USB external drive

* Zip 250 IDE internal drive

* 2gb pc100 dimm memory (four 512mb dimms)

* 1gb pc100 dimm memory (four 256mb dimms)

* 128mb pc133 128mb dimm memory

* Protec bytelan 4way keyboard/video/mouse switch box, includes power
supply, doesn't come with cables

* Brother model 7150c 6-in-1 MFC color printer/fax/copier/scanner/vid
capture
See more details here:
http://www.superwarehouse.com/p.cfm?Brother_MFC_7150C&MFC7150C&p=119409

* Panasonic/Apple 2.6\5.2gb DVD-rom/DVD-ram IDE drive with four 2.6gb
(single sided) dvd ram cartridges (no drivers needed for
Windows XP, for other operating systems you will need to find drivers)

* Sound Blaster PCI sound card

* HP 10/100 PCI network card

* Teac 32max IDE CD-rom reader

* Mitsubishi IDE internal LS120 drive model MF357G-2111UAL

* NEC internal floppy drive

* HP C4459-56000 IDE CDR-W drive 8x/4x/32x 9100 series cdrw burner

* HP Vectra VL400 MT computer with 17" Hitachi Monitor and HP Laserjet
4l Laser printer
Windows 98se pre-installed with EULA
Intel Pentium III 933 mhz processor with 256 KB level-2 integrated
cache and 133 MHz front side bus
256 MB SDRAM memory at 133 MHz, expandable to 512 MB maximum
40gb Hard Disk
HP IDE CDrw 9100 (with Roxio Easy CD Creator 5 basic)
Floppy Disk
Win TV/Cast PCI (for watching TV/Cable on monitor)
Onboard Video Intel 815 integrated graphics Direct AGP

Onboard Networking: 10/100 Ethernet
Onboard Audio: 16-bit stereo full duplex integrated sound
-20-bit stereo audio recording and playback
-Full-duplex audio
-AC '97 architecture
Chassis
-Two 5 1/4 drive trays
-Two 3 1/2 drive trays
-Three free PCI slots
-One AGP
Built-in i/o:
- One 25-pin parallel port
- Two 9-pin serial ports (16550 UART)
- Two PS/2 connectors for keyboard and mouse (Mini-DIN)
- Two stacked Universal Serial Bus (USB)
- One 15-pin VGA connector on system board.
- Audio ports (stereo-in, stereo-out, microphone-in)
- One RJ-45 Ethernet port (10/100Base-T)
+Multimedia keyboard
+Mouse

* Apple Newton message pad with box of software (business and games),
Windows connection kit, 2mb memory card, newton serial
keyboard

* Atari ST Computer Hardware and software:
Atari ST Sams Manual
1040 STE, 1mb ram, 720k floppy, TOS 1.06
1040 STF, 1mb ram, 720k floppy, (missing TOS Roms)
Mega STE, 4mb ram, 720k floppy, TOS 2.04, ajax chip for 1.44 floppy
support, internal scsi hard drive, keyboard
2 Konica scsi 10mb 5 1/4 floppy drives, with box of 30+ disk
4 external 720k floppy drives
1.44 external floppy drive (modified ST floppy case)
4 mouse (atari and other brands)
Atari CX22 Trackball Controller (modified for ST)
Migraph hand scanner with cartridge
3 dma cables
ICD Link external scsi controller
SM124 Mono monitor
SC1224 JVC color monitor
Extra keyboard for ST
Xtra-RAM Deluxe kit for ST with 4mb ram (add 4mb to older ST models
easy)
Seagate ST32550N 2gb scsi hard drive
2 IBM OEM 4gb scsi drive model DCAS-34330

* Atari TT Hardware:
Atari TT back plate with serial 1 & 2 connectors and cables

* Atari 8bit Computer Hardware and Software:
Atari 800XL
Atari 1050 Disk Drive
Wico Bat Joystick
Wico Ball Joystick
Atari CX80 Trackball Controller (rare find, not many of these around)
All Power supplies included
Composite video cable
Super Breakout cartridge
Signalman Mark II 300 baud modem (rare item for collectors)
Joystick extension cable
Joystick Y adapter

* Atari 7800 Hardware and Software:
Atari 7800 Pro System
2 Mercury Joystick Controllers
Atari Paddle Cotroller
Atari Driving Controller
Atari Keyboard Controller
Star Raiders cartridge w/Video Touch Pad
BallBlazer cartridge

* Atari 5200 Hardware and Software:
Atari 5200 Trackball
Atari 5200 Joystick
Jungle Hunt cartridge

* Anime / Jap software & Music:
Anime Hyperguide Volume 1 - Project A-KO
Tenchi Muyo screen saver
Bubblegum Crisis screen saver
Ranma 1/2 screen saver
Demon School video CD
L'elisir D'amore video CD
Urotsukidoji Legend of the Overfiend video CD
Graduation Game CD
RG Veda digital movie (gametek cinema)
Robotech digital movie (gametek cinema)
Ranma 1/2 music CD
SM Girls Saber Marionette J music CD
Maison Ikkoku best collection music CD
Graduation teach me please music CD
Cyber Formula GPX singles music CD (2 cd set)
Blackboard Jungle video CD
Ninja High School comix CD
Inner Brain title game CD

* Roller Blade brand rollerblades size 9-10, knee pads, elbo pads and
wrist guards

* NEC Multisync mt600 color projector 800x600 max resolution,
composite and rgb/vga inputs, with remote and cables. Has wear
on one side from removing and replacing to storage.

* Panasonic DVD-L50 portable DVD player (excellent condition, light
scratchs on case top) with all cables, remote and battery.
plays DVD, DVD-r, SVCD, VCD, CD Audio and switches to monitor to plug
vcr or game system in and play on screen with audio. Has
video in/out, audio in/out, svideo, headphone connector. For more
details see:
http://www.amazon.com/exec/obidos/tg/detail/-/B00000JFMK/tech-data/ref=e_de_a_smtpd//103-8
397279-1086253?v=glance&s=electronics&vi=tech-data

* Apex AD-1100W DVD Player (new in box) plays cd with *mpg files, cd
with *jpg files, cd with *mp3 files, DVD, DVD-r, SVCD,
VCD, Kodak Photo CD, Audio CD, CDR Audio, has region code and
macrovision removed to play video from other countries and
allows DVD playback on projectors and copying to vhs tape (Hot item,
this is the 1mb rom unit that can be reprogrammed and is
saught after everywhere by video lovers)

* Pioneer laser disc player model CLD-D503 plays Laser Disc, CD Audio,
CD+G. Both side play (no flipping disc, unit is sensetive to low
quality disc that create more vibration) with remote and 93 Laser Disc

Are you shure you need a login script?

It's more common that the ppp negotiations (or initialisation link)
starts right away. Otherwise Windows users would not be able to connect
at all :-)

I would try with a frech DIAL.SCR right from the STinG archive and just
start the Dialer and enter my username, password and select ppp.

Message-ID: <b4bahn$3ih$1@news7.svr.pol.co.uk>
Source record: 28950

Hi everybody!

Just got hold of a copy of Zero-5 second hand (Damn good programming, strange stereo sound system, using monitor's internal speaker for one channel and external phono connectors for the other!), but no manual. Can anyone tell me where can find a copy or scan of the manual, or perhaps just tell me what all the keyboard controls are please?

Also, does anyone know if the Jaguar controller makes the game any easier to play? I don't have a Jag controller, but I've managed to find a circuit diagram, and wondered if it would be worth trying to build one.

Thanks.

Tom

Micheal,
My experience with STING 1.26 has been that it is in the login script. Even though it makes it past what looks like the USERNAME and PASSWORD. The connection is not fully established until the server has sent back confirmation of your information. All you have done is sent the information not recieved information back that you are fully connected. Here is a sample script that I have used with my ISP that worked fully in December when I resetup STING just for giggles.

```
WAIT = 500
REPT = /
FIND = ogin
RESP = firest
#
WAIT = 500
REPT =
FIND = ord:
RESP = sakata
#
#WAIT = 500
#REPT =
#FIND = prompt
#RESP = slip
#
WAIT = 500
REPT =
FIND = Your IP address is
RESP = $GET_IP
#
```

RESP is the response to the password and username. # signs anything after them are ignored. If you wish I can send you my files for you to look at and see if you can figure anything out with them.

Just ask and I will send them to you.

You might wish to check with your ISP to see if they use CHAP or SLIP or PPP.

Thanks,
Carey Christenson

toss the heap of shit in the bin, but keep the controller. it can be used on the far superior SLM 605, for which all parts are still available. I have both printers, and both of mine are as new, inc. the 804. but I work in the industry and have found similar parts etc for my 804 to keep it going. others will not.

>back confirmation of your information. All you have

For a SLIP connection this is true and the very important info the server
sends back is the IP address. So this part of the script must be correct:

>FIND = Your IP address is
>RESP = $GET_IP

>You might wish to check with your ISP to see if they
>use CHAP or SLIP or PPP.

This is the important thing to check!

If they only use SLIP (most unlikely!) you need a login script.

If they only use CHAP get another IP stack or ISP!

If they provide PPP use that and you don't need any scripts at all.
Here's the (empty) script part of my DIAL.SCR:

```
# Dial Script
#
FIND_TIMEOUT = 60
#
DIAL_SCRIPT
#
```

To know what protocol your ISP uses check there info for Windows users.
If they are prompted to use "secure" login with PPP then they use CHAP.

If the Win users must install a special login script then there is SLIP.

Can somebody help me.
I recently got a A3 - digitizer CRP (Cybernetical Research & Production)
for Atari ST TT and maybe Falcon. I have some software with it, but no
manual or other information how to connect this drawingboard to my Atari. I
Think its connected to the serial port of the Atari.almost certain about it.

Can somebody help me please?

Well, easier said than done. The ISP that bought out my old ISP (that bought
out my original ISP), sent out special software that automatically
configures any Mac or PC's internet software to their specifications. So,

their site info just says to install their latest software. I then have to go into my Mac's Internet and TCP/IP control panels and copy what little info it gives me from there and hope it works. When I try to e-mail them to ask what protocols they use, they simply refer me either back to their site (which doesn't give that info), or call or use their online support service (kind of like an ICQ chat with support staff). When I call or use their online support service, they read through a pre-written script and won't simply answer my question. The script tells me to open certain menus or windows that are specific to Mac/PC software, and when I tell them that I either use an Atari, or tell them the software I use, they simply say that they can't support that hardware or software. So my ISP is absolutely no help at all. What annoys me is that my original ISP was the only one I could really find at the time that was really helpful and interested in getting me online with my Atari.

As far as the connection protocols, I'm pretty sure it's not a SLIP connection, and I read recently that STiK2 doesn't use CHAP, and it connects fine. So it must be something in my configuration of STiNG. I'll keep trying... Thanks!

1178. What if... the Lynx came back?

Newsgroup: comp.sys.atari.st
Date: 2003-03-08 19:18:56 UTC
From: Luposian <luposian@lycos.com>
Message-ID: <3e6a4205$1_7@corp.newsgroups.com>
Source record: 28960

And it ran at between 700-800MHz, had a 640x480 LCD display (about 9" diagonal), 24-bit color, 3D capabilities, had 128Mb-256Mb of RAM, built-in OS, battery pack (so you can play on the road), and... you could still hold it in your hands (imagine the Lynx, just SUPER-SIZED), for both left and right-handed players (just flip it around; an internal sensor detects the change and flips the screen to suit)

Not to mention having a starting line up of games consisting of remakes/enhanced versions of Atari 2600 classics (like Adventure) and exclusive remakes of arcade games like Pengo (2003) and Pac-Man (Senior), plus... all-new, original games, never before seen...

What would you be willing to pay? $100? $200? $300?

Remember, this wouldn't be a game system to beat other game systems (either in marketshare or performance). This would be a game system to simply fill a void in the niche which it once occupied. A game system to hopefully revive the platform which once stood proud. To revive the brandname which started the whole home-video game genre...

After realizing a "laptop game system" was not financially feasible from both a design and consumer cost stand-point, I looked at the disembodied 486 LCD display sitting on the shelf in my workshop and thought to myself... "You can hold this thing in both hands like a Lynx! How can you get it to BE a Lynx?"

The parts to make the "Lynx II" exist can be aquired. If, but a simple working mockup could be built and presented to the right people... But the cost to build, even a mockup... Not a thousand dollars... but it also wouldn't really resemble what we want to show. Plus, that and a game or two to show off.

If only we had a couple people interested in writing the game demos and designing a crude case (even out of wood or sheet metal or something) around the parts... we might be able to pull this off... at least enough to SHOW people what it might be like. Let them decide...

I never cease to keep thinking it MUST be possible... somehow... someway...

And this time, it's even cheaper to do.

Luposian

Well,

People don't understand that until *everybody* stops using a garbage ISP
they're going to remain a garbage ISP or only get worse. Speakeasy
DSL/dialup is really expensive but they're a *real* provider.

Just my $.02
Mark

Well, if STiK2 works then STinG should too!

Anyone else who use an ISP where STiK2 works but STinG doesn't?

I just made a DIAL.SCR from scratch using nothing but the STinG dialer
itself. Took it to the Stacy and got online without any problems at all.

I only manually edited:

PAP_ID to my login name
PAP_PASSWORD to my PAP password (login password)
PHONE_NUMBER to the number to my ISP

You must edit SERIALPORT to Modem 2 or whatever port you use.

If your ISP uses normal PPP it should work.

This is the DIAL.SCR I used:

```
--------------------------------
#
#
# General Parameters
#
SERIALPORT = Modem 1
DEF_ROUTE = TRUE
MASQUERADE = FALSE
EXEC_BATCH = FALSE
CIX_LOGIN = FALSE
RESIDENT = FALSE
DEBUGGING = FALSE
#
#
# Port Parameters
#
CLIENT_IP = 0.0.0.0
MTU = 0
PAP_ID = Your_user_name_here
PAP_PASSWORD = Your_password_here
PAP_PROMPT = FALSE
```

```
PROTOCOL = 1
VJHC = FALSE
LAN_PORT = FALSE
#
#
# Addressing
#
USERNAME =
FULLNAME =
HOSTNAME =
FETCH_DNS = TRUE
#
#
# Modem Specifics
#
INIT = ATZ
PREFIX = ATDT
HANGUP = +++,ATH
CONNECT_WAIT = 60
REDIAL_DELAY = 20
SUCCESS = CONNECT
FAILURE = BUSY
FAILURE = NO CARRIER
ABORT = NO DIALTONE
#
#
# Telephone
#
PHONE_NUMBER = 012-3456789
FEE_FILE =
ISP_TIME = 0, 0.00
ISP_SENT = 0, 0.00
ISP_RECVD = 0, 0.00
#
#
# Network Environment
#
#
#
# Dial Script
#
FIND_TIMEOUT = 30
#
DIAL_SCRIPT
#

Could somebody please post the source code for the video demo program
from the Mark Williams C manual for the Atari ST? I believe it was
about
10 to 20 lines of code and it allowed you to reset the base video
register
to low memory so that you could actually watch the bits of the operating

system in action.

Thanks,
Anthony Nemmer

Mark and Michael,
I would most definetly agree with you Mark on this
matter. My ISP is very helpful when I tell them what
type of system I have. When I have questions they
always tell me is there something similar on your
system that mentions this or that. Matter of fact
they told me one time that they were very happy to see
that there servers work on more than just Apples and
PC's. Just my thoughts also in this matter. I would
seriously look into a different ISP if you have other
options.

Thanks,
Carey Christenson

: Well, if STiK2 works then STinG should too!

My STinG 1.26 does CHAP. I do things the hard way. First, I did a web
search for the RFC on PPP, and read it. The rest I do not remember, since
it has been working for at least two years. My provider of a PPP connect,
Mindspring.com, requires CHAP, which mostly requires that my logon name is
jimd11@mindspring.com. That is, for reasons not known to to me, a "fully
qualified domain name".

Go thou and do likewise.

Jim

Nobody will be interested unless it has a slot for and can play with precisely accurate emulation lynx games. No OS wading, no crap. The slot should take over all functions. Only then does it deserve to be called a lynx. Seems now what you are building is a nice idea and all but I would be more likely to go out and by a gameboy advance. It's much smaller and has more features and more good games. Now that sega's games are being made for GBA AND Nintendo's games, it's like perfect harmony.

Besides - I have a lynx and I can get more ;-)

Just my $.02

Hi Will,

WVD>Think its connected to the serial port of the Atari.
right.

I'm going to ask a friend who had one, but threw it away for it didn't
work after it hadn't done so some months ago. Maybe he held the manual.

I'm pretty sure that the speed on serial should be 9600 b/s.

Hi everyone,

I am a atari 8 bitter at heart (first computer was an atari 400 given to me in 1980) and have collected and acquired anything atari for the last few years but i never came across anything ST related at all.

well my first score was yesterday, i got an atari 1040stf (with an aftermarket toggle switch on the back, what is that?) and monitor for it, and i also got a TT030 system with the keyboard, mouse, and console. Got everything for 12.90 (including tax) at the thrift.

I need guidance on what to do with this tt030. I plugged it into an old vga monitor and it boots and goes though the memory test (8 megs). the hard drive light (40 megger?) flicker on and off like i suppose they should.

But when the machine finally boots to the desktop, all i see are 2 floppy icons and a trash can icon. How do i access or test or do anything with the hard drive icon.

I have never ever used an 16 bit atari before so i am totally lost at this.

Also how do i tell what verison of the TOS do i have? when i click on desktop and about this desktop, all it gives me are a bunch of dates which of the latest is 1991 but no version numbers.

Any sites that tell how a newbie like me gets started with an atari st would be great. I would like to at first at least download a couple of games and put them onto a 720 kb floppy and unzip them and see how they run (just to get a feel for the system) at first.

Thanks
Bo

If you don't see a msg about a HD driver at boot up just after the memory test then it won't be accessable. You will need to hunt down a copy of the Atari HD tools on the net.

Under one of the menu's is "Install drive or device" or similar wording. Select that, it will prompt you for a driver letter, type an _uppercase_ "C" hit the ok button. A drive "C" icon should appear if the HD driver is loaded.

Is there any kind of marking on that extra switch? Where about on the case
is it located? I'd guess it could be something to do with the hard disk, or
possibly a floppy drive density selector (but most of the floppy upgrades
out there use automatic selection)

Or it could possibly be a TOS version switcher, if the previous owner got
ambitious and installed the multi-TOS uprade. Try rebooting with the switch
in different positions and compare the release dates on the system info box.

The only other upgrade you could really do to an STF would be to add extra
memory, and I can't imagine that that would need a switch....

Most likely it could be a resolution changer, for using a hi-res mono
monitor and RGB low-res monitor both plugged in at the same time - the
monochrome monitor outputs an identifying signal to let the computer know
it's plugged in, and the standard trick to avoid swapping plugs around is to
cut the signal off with a toggle switch. WARNING: If it is a res-changer,
changing resolution whilst powered up automatically reboots the machine.
I've lost count of the number of times I've had a game ruined by someone
being unable to resist the temptation to push the button. Maybe making my
resolution-control a big red knob on a mysterious black box sprouting many
cables was a bad idea...

Hi Bo,

�But when the machine finally boots to the desktop, all i see are 2 floppy
�icons and a trash can icon. How do i access or test or do anything with the
�hard drive icon.

Press alt key and C : you will get a window with what is on the partition C.

�Also how do i tell what verison of the TOS do i have? when i click on
�desktop and about this desktop, all it gives me are a bunch of dates which
�of the latest is 1991 but no version numbers.

You need a programm for that (I.E. sysinfo.prg can be found on Chapelie).

�Any sites that tell how a newbie like me gets started with an atari st would
�be great. I would like to at first at least download a couple of games and
�put them onto a 720 kb floppy and unzip them and see how they run (just to
�get a feel for the system) at first.

You can't imagine how lucky you are to get a TT, it's a real 32 bits CPU.

Regards

[snipped script]

Well, I tried your script, entering my personal info, and it didn't work, either. For what it's worth, here's what my ISP sends when viewing it through a Terminal program (after the usual "CONNECT 31200...") stuff that really shouldn't make much difference, as far as I know. I'm putting {brackets} around my responses just to make the difference more obvious here...

Username:/Login:/Login:{nameerf@flash.net}
Password:{********}
Entering PPP Session.
IP address is 65.58.139.174
MTU is 1524.

After this come the jumbles of characters that are the PPP transmissions.

In STiK, I have it set on a script to just recognize the "name:" and "word:" lines, followed by my responses. This works perfectly in STiK. I set STinG to the same script, and it refuses to move beyond the "Initialising Link" phase. I've also tried removing the script, and the only difference is that the dialer skips the login segment I'm used to seeing and goes right to the "Initialising Link", where it again gets stuck. I do have (and have always had) the PAP info filled in correctly as well. I've also tried adding the "IP address is" and $GET_IP response to the script, as suggested by someone else. No luck there, either. It simply puts an IP address into the "Got IP" line, then gets stuck at "Initialising Link".

Comparing dial scripts and config files, everything in my STiK and STinG files that can be identical are identical. Yet one works fine, one doesn't. Unfortunately, it's the one that doesn't that I have to be able to use.

As far as peoples' discussion about using a different ISP instead of a "garbase ISP" as Mark D put it... That'd be fine if it weren't for the fact that I am under very difficult financial conditions that prevents me from using a more expensive one, and haven't found one the same price or cheaper that I have been able to confirm will work. So ideally, I agree with you, and in fact the ISP I originally had before they were bought out were very Atari friendly. Unfortunately, they were bought by what you would call a semi-"garbage ISP" (at least it worked with my software, although they didn't show any sympathy for Atari users) and then that company was bought out by my current ISP.

So, I'll keep trying things. I really appreciate everyone's help so far! Hopefully it will come of something for me! Thanks!

Quite a fantastic deal - especially for a TT, don't let it go for that
little money unless it is to me ;-)

http://storage.atari-source.com/storage/atari/mirrors/chapelie.rma.ac.be/atari/utilities/disktools/cbhd502.tos
If you follow that link and download that file, it will give you CBHD.
Transfer it to a PC formatted 720K disk and then put it on the atari and
run the TOS file and it should extract the software. Hopefully most/all
of it will be able to fit on a 720K disk. There will be a folder inside
the CBHD folder after you run that TOS file (just an auto-extractor)
called auto. inside auto will be cbhd.prg or something similar. If you
runr that it should detect your internal scsi hard drive and install a
drive C: partition.

There's 2 possible reasons the hard drive isn't automatically booted and
gives you no messages.
1) the previous owner wiped the drive clean - so clean it has no booter -
unlikely..
2) the internal drive is toast, I've had those TT hard drives die left and
right. Don't be surprised if the drive doesn't work at all. You'll have
to crack open the drive bay case and remove the scsi drive with something
similar. Most internal scsi 2 50 pin drives work fine given that they are
properly terminated and such.

>

Other users suggestions for garnering a drive C: icon are valid but I
highly doubt you have a hard disk driver loading at all. This will make
this icon simply not be valid.

> I have never ever used an 16 bit atari before so i am totally lost at this.

On the 1040 you probably have TOS 1.62, on the TT either 3.05 or 3.06.
It's not very important.

That's easy except a lot of games come in .MSA format which is the atari
magic shadow archiver which will extract that file to a floppy disk. This
only works on an atari ;-). Best to get that hdd working in the TT and
get some software like that setup.

Hello

I have installed in.ftpd in my EasyMint setup to transfer files
between my Windows laptop and my Falcon through my Ethernec adapter.
When i'm trying to transfer a big directory my Falcon always hangs
before all the transfer is done. Not always but sometimes i get this
message: "pid 150 (in): buf_free: invalid buf size: xxxxxx ".
Could be a problem of a lack of memory?, i have 14 mb. The Ethernec
driver?, May be should i modify some parameters in some configuration
file?. Any suggestion would be apreciated.

Thanks.

Not true. There are PC utilities around to convert .MSA files to .ST disk images. However, they are now obsolete, as the latest version of MAKEDISK, the best of the PC atari disk writers, now supports both ST and MSA files. It doesn't autodetect the file type, funnily enough. It assumes you're giving it an ST file, and you have to include the .MSA extension in the filename you type when starting the program.

Hint - It's a VERY good idea to use authentic, double or single density disks (the ones that don't have a hole on the opposite side to the write-protect switch) when writing disks to be used in an Atari with the factory-installed low-density drive. I've tried using high density disks and they behave erratically. Sometimes they work, sometimes they don't. Interestingly, a low density disk written by a high density drive will work fine. If you want to start collecting ST games, buy the low density disks any time you see them, as I'm not sure if anyone still manufactures them.

There's over a page of source, mostly repetitive. It basically goes like this...

#define UP_ARROW 0x4800
#define DN_ARROW 0x5000
#define HELP 0x6200
etc

cur = old = Physbase();
appl_init();
while (!done) {
switch (evnt_keybd()) {
case UP_ARROW:
cur -= 1280;
if (cur < 0)
cur = 0
;
SetScreen(-1L,cur,-1);
break;

case RETURN:
done = true;
break;
}
}
SetScreen(-1L,old,-1);
appl_exit();

Curious to know if you setup in.ftpd properly through inetd. You need to
install inetd and then setup the ftpd line in /etc/inetd.conf. I assume
you probably already know that however.

Next step might be to get a bug-fixed sockdev.xdd (or to upgrade to a mint
1.6 kernel with inet4.xdd. This solved a number of problems I had, though
I've never received that error. Have you tried the assemsoft mint
ethernec driver on http://assemsoft.atari.org ? And lastly what ethernet
card chipset is your NE2k card. It coudl make a difference if it buckles
under heavy traffic. Try using wget or another program and transfer a lot
of data and see if similar things happen.

Thanks
Mark

Does your ISP really send the words "Username:/Login:/Login:"? Then
maybe should you make the script wait for say "gin:/Login:" instead of
"name:".

Also, I'm not sure you can set at the same time a script _and_ PAP infos
in the *.scr file.

Bye,
/Pascal/

Yes, ideas.

STiNG comes with a debugger program. It will make records of the
transactions in trying to negotiate a connection. Try it, and read what it
records, and that might help.

And, in the STiNG configuration file, there is a section for putting in
the right stuff for CHAP. Note that CHAP does not use a script. Most
likely you are missing a "fully qualified domain name" someplace. For me
that is jimd11@mimdspring.com.

I do not know about STiK2, or how that does CHAP, if that is your problem.
It is, I suppose, possible to concatenate the user name and the host name,
to make what is required, but I know STiNG 1.26 does not do that. You have
to do it for yourself, in the configuration file.

Jim

Is there a way to get video on the Mega STE to display on a VGA monitor? A plug in card or something like that?

Thanks

Tony

Tried that. Same effect. Also, when I try adding a FIND to detect the "IP address is" line, followed by a $GET_IP response, it does indeed get an IP, which it wouldn't if the ISP side didn't accept the login as it was.

> Also, I'm not sure you can set at the same time a script _and_ PAP infos

I'll have to try this, although I've been using it that way the whole time, even when my ISP did work with STinG (before it was bought out and everything went bad). But, it is worth a try! Thanks!

So, does that mean that in the DOMAINNAME line of the DIAL.SCR, I should put
nameerf@flash.net? The full thing is what my ISP requires for login, as you
said yours does, but I think that is because they have about 5 or 6 domains
that they own and run through the same phone numbers, and that's the way
they determine who's on what service.

> I do not know about STiK2, or how that does CHAP, if that is your problem.

I read in a MyAtari article that STiK2 doesn't work with CHAP (although
you're the only one who hasn't told me that STinG *doesn't* do CHAP, so who
knows who to believe at this point). Thanks for the info!

It might be worth pointing out that there are some translated files to go
with the CBHD package available from my web site.

Same goes for the CyPress package that was mentioned a couple of days ago in

You just need a suitable adaptor to use monochrome 640*400 on a VGA
monitor. http://www.1632systems.co.uk/ usually have these in stock but
right now when I did a check it said "sold out".

Btw. the web page looks rather bad with strange and unreadable text
colour in CAB. Cured bye disabling "Use document settings". Alsp all
pages are "Untitled document"...

Anyone,
Lately, I have noticed that CAB is downloading and
storing nothing to the cache folder but a few bytes of
information. So I reinstalled and used a previous
CACHE that was burnt to CD. After starting CAB up it
went ahead and downloaded Yahoo and proceeded to
access the hard drive for 15 seconds or longer. In
that CACHE folder was 12 megs of stored files and as I
had suspected, after downloading Yahoo it went ahead
and deleted the entire cache. Is there any reason why
this should happen. I have CAB pointing to the
correct folder for the cache. What could be going on
here.

Thanks for the information in advance,
Carey Christenson

Hi Carey,
Possibly a CAB bug?
Just a guess that you've exceeded the max ram (14 meg I assume) or
max setting for hard drive cache (not enough room on the hard drive for
that CAB setting).
12 meg + boot programs + Yahoo = over 14 meg but Cab on my Falcon will
only stop showing pics at that point.
I'd suggest saving and renaming the 12 meg cache and creating another
cache folder or set CAB to delete the folder upon quitting so you start
fresh the next time.

John G.

Source record: 28897

John,
Thanks for the suggestion. But I have stored over
40 or 50 megs in my Hard Drive CACHE before. I set
the RAM CACHE to 4 megs and told it to keep 256Kb
free. Now CAB is only storing like at most 20 to 40 K
and most of the time it is just a few bytes. It
almost acts as if every time I access another web-page
it deletes everything that it previously had in the
CACHE from the folder to load in the new page. I dont
remember setting anything up that would do this
before. The reason I told you about the 12 meg cache
was because I installed that cache to confirm in fact
it was deleting the folder when I would load in a new
page. And as previously stated after CAB loaded in
and it downloaded YAHOO it was accessing the hard
drive for over 15 seconds and after Yahoo finished
loading I confirmed that it in fact had deleted the 12
meg cache folder I had installed. Anyone have any
idea what would cause this to happen?? Is there a
setting in CAB or MAGIC+Jinnee??

Thanks in advance,
Carey Christenson

Hi, all!

In both Newsie (latest) and MyMail (early) I have been betrayed by an unexpected crash on accessing either Get Mail or Get Selected Mail. I cannot get any emails.

This has never happened before. I have no new alterations to the system or new apps or utilities or patches on my TT030. I have rebooted several times, and even disabled every ACC except Xcontrol.

I have also reviewed my Newsie preferences: all OK, nothing changed.

I'm at my wit's end. Can anyone suggest what's wrong and what to do about it, please?

Thank you,
Charles.

Well i downloaded cbhd form some site (i think the main site) and once it
was on my mac, i unzipped it.

i then copied the tos file to my 720,kb floppy

put that into the tt030

opened it up.. it then unzipped a bunch of files.

i then doubleclicked on something in one of the folders and then it detected
everythning scsi wise.

Rebooted the mahcine and whooo hooo, my drives show up now.

I had no idea what i was doing cuz everything was in german.. that bothered
me.. LOL

but i now have a desktop with working drives.

Now how do i test the drive (like scandisk) to make sur ethat the drive is
good and the files are good?

also what can i do about the horrible mouse (without resorting to buying
extra hard ware, is there anything i can do with a standard 9 pin serial
mouse ?)

Bo

1223. How do i browse the web with a TT030?

Newsgroup: comp.sys.atari.st

I do NOT profess to be knowledgable about things atari, however years of support for ISP's and a major office product for a company has taught me something about totally unexpected crashes when checking for new mail.

You probably have a corrupt email on the server. Whats happening (and i have seen it happen MANY times) is that when the mail program is trying to make sense of th eheader or whatever, it is expecting one thing, but something totally unexpected comes though and bam, the application crashes.

Goto www.mail2web.com and sign on to your email account (this is a webmail program). That should bring up your list of emails that are on the server. Go though them and delete all the spam and everything of that nature. If you can, read the emails while on mail2web.com and delete them. ONce they are all deleted, THEN reopen the email program that is crashing and check your mail. It should work then.

good luck
bo

> to buy the ready-made adpter?

Actually one of my key questions regarding the atari mouse is this: Why
does the atari mouse appear to have 2 sets of light sensors for each axis
(as in the x axis has 2 light sensor assys and the y axis has also 2 light
sensors). I was thinking of just by passing those sensors and running wires
to a microsoft mouse and disalbe the onboard electronics of the microsoft
mouse and directly solder the 2 buttons (easy) and the light sensors,
however the microsoft mouse only has 1 light sensor assy on each axis so i
don't know if it would work.

Thanks
Bo

Bo,
I can attest to this kinda of problem also. This
weekend I got a 209K file that would not download to
my computer. It would basically stall out Emailer and

would not finish the download. After disconnecting
from the server I found that it was a "INTERNET
EXPLORER UPGRADE PATCH". Basically a VIRUS.
Microsoft does not send updates to people. To much
time to do that, they figure if people want the
upgrade they will check the site quite regularly. I
had the text part of the email but not the
attachments. Basically the program got to the
attachments and stalled out. Never have had this
happen before but some Email programs have wierd ways
of handling strange incoming messages. Obviously
NEWSIE is not well equipped to handle such strange e-
mails. And obviously Emailer does have its limits but

it was easy enough to delete message from the server.

Try anyway you can to check messages on your server
and see what ones are not necessary and delete them.

Thanks,
Carey Christenson

With utility software. A good place to start is with something like
Checkdisk (See http://www.geocities.com/SiliconValley/Bay/8745/pages/files2.html#disk)
.
>
> also what can i do about the horrible mouse (without resorting to buying

A serial mouse works fine, at least with GEM programs. It might not
work with games. (See http://members.aol.com/tgkirk/pcstmous.htm).

Corrupted drivers, perhaps? I'd reinstall STing (or whatever it is
you use). You might also want to try a newer version of MyMail --
it's getting better.

Hallo carey!

CC>Anyone have any idea what would cause this to happen??

This might be a bug in Cab. Check options/cache, there's an entry for the actual cache size (or what Cab believes it is). My Cab displays 920MB there, albeit it's less than 100MB. I've set the max cache to 999MB, and Cab stopped deleting files from the cache. I'll have to delete the cache and start from scratch some time :-(

Message-ID: <3E6DB390.2FBD67F@siemens.at>
Source record: 28914

Hi,

Quite some time ago I bought the game Rock n' Roll Clams from an Atari
dealer. Since he did not react to my questions maybe someone here
can help me.

When I tried the game on the Falcon at loading of disk 2 I got the
following text displayed :

CASPIAN Software - user notice !
Unable to find file called :
Jy
Please press [Return] to continue.

After that it returns to the desktop.
When I tried it on the ST it only loaded the 'music box' screen
with no music to be heard and after that screen returned to the
desktop.

In the meantime I bought a second Falcon and a second ST and tried
it on them with the same results.

Does anybody have any idea what to do so I could finally get the program
to run ?

BTW, there's another game called Tusker I bought from another Atari
dealer that doesn't boot correctly but hangs at some intro screen.

Both games were new, never before opened packages.

regards
Gerhard

No but I have similar problems like half invisible dialogs. Most of the time draconis installer(s) crash for me just before actually extracting archives, though the settings pages just before that aren't visible even though I installed the dialog SLB's properly.

http://hardware.atari.org - look under ethernet for atari. Purchase the
EtherNEC and have him ship the ISA card with it as it seems to be picky
about which Ne2k card you use. This is the cheapest - best solution for
your particular situation probably.
Thanks
Mark

I can read most german now as a result of that ;-) Lots and lots of
software is in German. There are kind people out there that translate

software to English but there has to be people that need/want it.

> but i now have a desktop with working drives.
>

Good to hear! Remember, you have to wait to press any keys on the TT
keyboard UNTIL the drive inside is completely spun up and the light turns
off or else it wont' find it and will go straight to the desktop.

> Now how do i test the drive (like scandisk) to make sur ethat the drive is
> good and the files are good?

The best utility I have found so far is Correct but it's commercial and
comes with the program "Kobold". Available at
http://www.europe-shareware.org

>
> also what can i do about the horrible mouse (without resorting to buying
> extra hard ware, is there anything i can do with a standard 9 pin serial

There's a serial mouse driver but it's pretty slim. most games and such
operate at the hardware level and will abandon the serial mouse driver.
However for most windowed applications it will work just fine. I have
found it to be a bit unreliable with Logitech mice but it seems to work
quite well with Microsoft mice. This mouse driver is available here:

http://storage.atari-source.com/storage/atari/mirrors/chapelie.rma.ac.be/atari/utilities/genmouse.lzh

Carey,

Probably it has something to do with CAB actually obeying cache
directives. Make sure the clock on your Atari is set properly. Pages
will be sent with headers that say "Expire on March 11 2003 at 9:00PM" or
something simimlar. If your computer clock is set into the future, it'll
probably delete stuff. Though that answer doesn't make sense because I
would think it simply wouldn't reference cached data rather than actually
going through and checking and deleting everything.

Bo,

I'm not sure doing that would be wise as the MS mouse probably is a lot
higher resolution than the atari mouse and it coudl theoretically cause
problems. I too have extreme disregard for the atari mice and think that
they're poor. One thing you can do is find a PC BUS mouse in a store
(round connector with like 9 pins). You can get a Microsoft mouse in this
style of connection. BUS Mice can wire up directly to the atari mouse
port. My roomate did this and I use an authentic ms mouse on my mouse
port right now (in addition to my 2 beetle mice). If you like, I can have
him try to find directions. I imagine wiring that mouse to a 9 pin
connector and having authentically working on the standard ports will be
better than a nearly as crappy old replacement mouse or a serial mouse
which doesn't work for some things.

Hi,

This is the latest news about the CT60 hardware:
- The SDRAM not works with the cache, acces works but it's impossible to run a program inside excepted when the caches are off with the PMMU of the 060.
- The good news, is than Rodolphe must receive a 16 channels 200MHz analyser in 4 days. This is a good solution for found timming problems. Until this days, only his scope without memory was used.

Regards,

Didier.

Excellent! :-)

>I had no idea what i was doing cuz everything was in german.. that bothered
>me.. LOL

Well, you do have to be very cautious when there's hard drives involved. Do
download the CBHD stuff I have - it might just save you some hassle in the
future.

>Now how do i test the drive (like scandisk) to make sur ethat the drive is
>good and the files are good?

Funnily enough, you can get HPOptimizer from my web site also (there's a MiNT-
only version which you won't want).

>also what can i do about the horrible mouse

I guess you mean that it's too slow? There are mouse speeders around. I use
the one built into NVDI myself.

Cheers

I've had this happen too.

I solved it by telnetting into the POP3 server and deleting it from the
server (I could more-or-less tell which mail it was from the number
downloaded before it went kaboom!).

Cheers

No, that would seem to be more or less the same thing.

But are you really waiting for a "Username" prompt, as it's more usual to be
looking for a "Login" prompt?

Run a terminal program and make careful notes of what it's asking for and what
you type in until the session starts up.

Cheers

FWIW I've had emails that would download OK, but Emailer would crash as soon as you clicked on a particular email. I sorted it with a well-timed poke of the Delete key, which deleted the message before it could be viewed.

I've also had occasion to visit the Database folder to delete a message that crashed Emailer whilst it was preparing to index messages.

I'm quite sure that both problems were due to attachments.

From: Bo Snyder <snyder@gonzaga.edu>
Message-ID: <b4lmdetne1@ns2.gonzaga.edu>
Source record: 28932

Hi again everyone,

I am going to be posting a few links to some pics of the 1040st that i got a few days ago.

The reason why i am doing this is because it apparently has some hard ware hacks in it due to the fact that it had a aftermarket on/0ff switch installed and on the inside the metal sheild that covers the motherboard has been hacked up in 2 places for 2 different aftermarket daughterboards (or so i assume!).

The bigger board in the middle says something about 4 megs but i dunno, looks a little small to be a 4 meg upgrade from that time period.

I will post the links as soon as i finish uploading the pics to the site.

Thanks
Bo

Thanks for both answer.

The problem looks like is solved after i installed the last Ethernec
driver (0.0.18) from Assemsof, i had version 0.0.14. Now my Falcon
doesnt hangs anymore but still have problems transfering big
directories, when the transfer is finished i see that only around half
of the directory files have been transfered.

I guess it has not relation with my new problem but my socket was
MINT-NET 1.5 PL 1 with kernel 1.15.12.

Is FTP reliable to transfer 400 Mb directories?

I'm a bit sadistic to my Atari's and I push them to their limits. I have transfered in one transaction several thousand files, about 2 gig with atari FTPD and vice versa using ncftp as the client. Ncftp for the atari sucks in it's current implementation. It's buggy as hell so I recompiled. If you want new binaries for mint, let me know and I'll send them.

Thanks

IIRC there can be a problem with Newsie if your mailbox is full. I think you cannot have more than 100 mails in an inbox. Worth a check, and if it's full, then you can move some to another mailbox, or just delete a few.

HTH

All the best

> to buy the ready-made adpter?
>
Using a serial mouse via the serial port is just a matter of plugging
it in and running a freely available driver. What Mario Becroft made
is an adapter to plug a serial mouse into the mouse port. That's a
bit tougher.

Alternately, you could use PS/2 mice...

Instructions for making a PS/2 mouse work with an Amiga are here:
http://rdc.gfns.net/ps2m/index.html

Then you need to adapt them to work for an Atari, which is fairly
simple. The instructions are here:
http://koti.mbnet.fi/archyx/productions/projects/amiga-atari_mouse_adapter/

Or, you could build an Eiffel (http://eiffel.atari.org).

Hi Carey,

>Is there any reason why this should happen. I have CAB pointing to the
>correct folder for the cache. What could be going on here.

This sounds very much like a corrupted cache to me, inside the tools folder
of CAB there's a program called "cabccln.tos". Put it in the root directory
of CAB and then drag the CACHE.CAB file on to it.
You will loose some cached files but roughly 95% of the files inside the
cache will be restored/saved from oblivion....

Cheers from Belgium

Is your cache folder located on a SCSI device?
If your moving large files across the SCSI DMA and using a high
resolution display while surfing, you may be getting DMA errors (on a
SCSI device only).
If the cache is on your IDE bus, then guess the other post would be
worth looking into.

km41c100ap-10 are 1meg 100ns ram chips, picture shows 16 so you have 2 megs there, look under the board maybe you have another 8 or 16 on the other side.(also you have one meg onboard) The other board at the front is a adapter that plugs into the socket for the mmu(maybe?) I have no idea what the switch is. take the shielding off and see were the wires go.

Bo,
I have a 1040STf with 2.5 megs of RAM and my 1.5 meg
board does not look anything like that board. My
question to you is have you tried running a
SYSINFO.PRG on that system?? It would at least tell
you if it has more memory in it. I would say that it
is a 4 meg upgrade. But not sure on that. I have
never seen a memory upgrade have a switch on it.
Unless it is combo upgrade. Maybe something like a
memory upgrade with a ROM upgrade built in. There is
long chip on that board that did not match the others
which makes me really question what this thing does.
It also looks like the wiring ran under the RF
shielding to another board which did not have very
good picture of that board. Be very interested in
finding out what this card is and what it does for
you. At any rate you got a very good deal no matter
what it is I am sure.

Thanks,
Carey Christenson

LOL about getting a very good deal..the 1040 was an afterthought while digging though a thrift and finding a TT030 system. I saw the 1040stf as well and just decided to grab it and the matching monitor just to have since i never had one before. Total cost was 12.90 including tax. I really got curious about the 1040 when i noticed that switch on the back of it while cleaning it. Thats when i decided to go ahead and open it up and then i was like "whoa, we have some nice little upgrades here". i am planning on reseating all the chips (not taking them out, just pushing them back) and then i will set it up in the basement and go from there and see what happens.

I am anxious to play some st games since i never had an atari 16 bit or better system until last thursday.

Whats the mmu that the other board goes into ?? i am going to take more pics tomorrow after i take the shielding off so we can hopefully figure out what exactly my 1040 has..

Bo

Yes, a PCI Adapter without busmaster capabilities is a dead PCI adapter.
This is the very reason Eclipse is useless with 99% of current PCI cards!
A PCI solution for the ct60 MUST be a 100% complete PCI implementation,
else it will be useless.

The information given to you by gimpo is correct. I had a Zubair memory upgrade just like it years ago. And if you look at the jumper by the front rainbow of wires it tells you to short j1 for 4 megs. The chips also help to tell its a 2 meg upgrade. The switch looks like it may be a TOS switch but you would need to remove the shield to make certain.

Don S is right its a zubair memory board, ST has two banks of 16 256k chips
giving you 1meg total memory. When you install the upgrade board it fills
the one bank with 2 megs leaving you 512k on the main board. So you have
2.5megs, to go to 4 megs you needed to cut some traces on the main board.The
MMU is the memory management unit, just a custom chip... I think the bigger
chip on the memory board is the video shifter.

Assuming the disks can't be read on an ST or PC:

Disks may be damaged due to exposure or age.
ST drives may need aligning or head cleaning.

If not readable on ST:
May be in PC format, and may need a drive patch or program for the ST to
read/copy.

I got Imagecopy 4.1. Hardly used it. Even with 4 megs of ram, it would load only about 10% of the pictures I had and wanted to work with. Couldn't spool to disk or actively scale as it was loading. And that was for sizes typical for 1997. And reply to an email I sent said it was my problem that no one else had.

Besides the loosend contacts in the mouse plug(squeeze with pliers), I have had to replace the switches in ST mice with great results. Replacing the mouse or tail(or just the connector) works also.

On my Mega ST with a "telephone" cord, I replaced it with a 7 foot cord and solved my keyboard and mice problems

Most of the long timers here are aware of and probably use the 6 inch Mouse/Joystick port extension cables as they reduce wear and stress on both the socket and sockets solder joints to the motherboard, but does anyone know if similar extensions exist for the Jaguar/Enhanced Joystick ports on the STe and Falcon.

You mean tring to load a 60k Jpeg? hese can decompress to more than 4Mb, and on a 68000 (i.e. STFM/E or Mega), virtual memory is not possible without upgrading the CPU to a 68030 or better. Virtual memory requires a MMU. So a Falcon, Milan, Hades, Eagle and TT are the only ones capable of such things. I have 78Mb ram in my Falcon and Jpegs can still bugger it up. Hate virtual ram anyway;-)

It appears to be possible, by a rather butchery enterprise, as explained
in the text which I found on the 'net once, and which is quoted at the end
of this message. I have never tried it.

>Actually one of my key questions regarding the atari mouse is this: Why
>does the atari mouse appear to have 2 sets of light sensors for each axis
>(as in the x axis has 2 light sensor assys and the y axis has also 2 light
>sensors). I was thinking of just by passing those sensors and running wires

>mouse and directly solder the 2 buttons (easy) and the light sensors,
>however the microsoft mouse only has 1 light sensor assy on each axis so i
>don't know if it would work.

As far as I know, there MUST be two light sensors on each axis, but in the
Microsoft mouse which you mention they are probably integrated into one
module. The need for two sensors stems from the requirement to detect
DIRECTION of rotation, not just rotation itself. It uses the concept for
some reason called "quadrature": two sensors must be placed at carefully
adjusted distances so that they detect position of perforated wheel at
exactly 1/4 of the pulse interval. So, when the wheel is turining in one
direction, one sensor detects pulses like this:

__|��|__|��|__|��|__|��

and the other one (with the same origin on time axis):

_|��|__|��|__|��|__|��

while, when the wheel is turning in another direction the second sensor
detects:

�|__|��|__|��|__|��|__

(notice the difference in phase relative to the first sensor). So, if
pulses are interpreted at, say, rising-edge-detections of the first sensor,
the second pulse train will at that moment be always at "1" or at "0",
depending on direction of rotation.

cu;

OK, and here is the text describing how to butcher a serial mouse into
an "atari" one:

---vvv--- Quote ---vvv---

A new atari mouse (from a serial mouse)

What do I need to buy?
a 3 button serial mouse. I used a Trust-mouse, but the description can easily be adapted for other mouse types.

a piece of 9-wire cable. This must be as flexible as possible!

a 9 pin subD connector

4 47k resistors 1/8 watt

an 74HC14 (hex schmitt-trigger)

maybe an extra resistor (read on...)

What equipment do I need?

a soldering iron (max. 35Watt, thin point)
a solder sucker
some small gauge wire
a piece of shrink sleeve
a hobby knife (to cut unwanted PCB tracks)
some experience in soldering is mandatory

Part one
Before making the mouse unusable as a serial mouse, see if you can identify the following items:

the IR-LED's
the photo transistors (there might be 4 of them when they are not integrated as indicated by the dotted box in the scematic). Also, follow the trace connecting the IR-LED's. There should be a resistor in this path. The extra resistor you need should have approximately the same value as the resistor you find here.

Part two
start removing the components you don't need (IC, crystal). Keep the traces and holes intact and remove solder from the holes. You might want to re-use the holes. find some suitable spots for the power-supply (+5v + GND). These usually have the most wires connected too... build the circuit for the IR-LED's, buttons and connect the elco (watch the polarity!). Cut traces if you have to... Identify the traces from the photo-transistors that you need to connect to. When you have, put the 74HC14 on it's back on the pcb and figure out how you can connect the resistors to the traces and the 74HC14. put the resistors in place (adding shrink sleeves when you feel it's necessary). When that's done, put a piece of double-sided sticky tape on the back of the 74HC14 and stick it onto the pcb. connect the resistors (as shown in the scematic) and the power supply to the 74HC14 (+5 = 14, gnd = 7). make a visual inspection of your work. It's much easier to correct things without a few meters of cable attached.... Connect the 9 pin subD connector to one end of the cable.

Write down the colour/pin relations. connect the other end of the cable to the various points in the modified mouse.

Part three
attach the mouse to your atari and power on the atari. If the power led on the atari doesn't light-up within a second, turn off your atari immediately and start looking for shorts or other problems. start GEM or X to see if your mouse works.

There are a few major problem areas:

none of the buttons work - very unlikely unless you made a cabling error. the middle button does not work - the connection between mouse connector pin 5 and joystick pin 1(??) is missing. You will have to make that yourself.

the mouse movement is flaky - add the extra
resistor by soldering it parallel to the existing resistor in the IR-LED circuit. Since the power supply has dropped (from approx. 15V to 5V), the IR-LED's may not provide enough illumination on the photo transistors.

one or all of the movements are reversed - exchange XA
with XB or YA with YB (dependent on the reversed direction ;-) frob a bit with the cable throughput. Since the new cable is thicker than the original, check the functioning of the middle button with the cable below it...

---^^^--- Quote ---^^^---

Only way I know of would be to use a null modem cable and the sting/newie/cab
software to access the web. I'm not sure if an eathernet card was ever made for
the TT. The Falcon has it's own LAN port.

For the mouse, you need to make sure it's rollers are clean, and check the pins in the mouse port, I've seen one or more of them get bent down and the mouse will not work right. Then you need a software mouse acc which you can set the speed of the mouse and the speed of the clicks, that does wonders for using the mouse. As for the hard drive all I have is the ICD set of files, but I use one of them for viewing my settings, testing the sectors and reformatting if needed. For defragging the drive I have cleanup on mine. All I need is a working keyboard.

1276. JAGFEST UK -- 14/15 June

Newsgroup: comp.sys.atari.st
Date: 2003-03-12 12:18:47 UTC
From: Nicholas Harlow <nick@1632systems.co.uk>
Message-ID: <b4n8iu$7ks$1@thorium.cix.co.uk>
Source record: 28857

JAGFEST UK
WHAT
A festival of Atari featuring Jaguar, Lynx and hopefully ST . Here you will be able to play all the great Jaguar games, link your Lynxes and maybe dabble on your ST's/Falcons. We want to include as many of you as possible.

Do you have a pet project on Atari, then come and show it off, do you want to try Battlesphere on your Jag? The we will have it (maybe even be selling it)

You want to trade/swap some of Jaguar/Lynx or Atari software. Brilliant, this is going to be the place to do it. 16/32 Systems will obviously provide some of the retail but if you've got it come along and do it.

Do you run or are you part of an Atari group, then you should be here!

When
June 14/15 2003

Where
Medway Manor Hotell, Rochester UK

Timetable of Events
To be confirmed by GAZTEE and will be updated as soon as possible. But your input would be appreciated.

Costs
2 Day Attendance Entry will be £20 UK (setup starts Friday Night-dismantle sometime Sunday). This includes snacks and drinks.

Hotel Rooms £30 per Night - sharing twin £55 per Night - single

Want to attend for just a day? Then the cost is £5 (Drinks and snacks extra)

Just let us know what you want

If you want to book, you can use Paypal, Cheque or Credit Cards -- then let Nick Harlow know at nick@1632systems.co.uk

MSN Discussion Group - Join and be a part of the best Atari Show in the UK this year all the latest info plus a complete website to add your views too.

http://groups.msn.com/JagFestUK

I apologise in advance if this potst has already hit the newsgroups but my news server seems to be hitting a few problems..

A much better solution: just drop Newsie and use Popwatch/Newswatch in
conjunction with Okami. This combo is by far the best one can get for the
Atari platform.
With Popwatch one can even delect mails on the server without retrieving
then first. Very handy to keep your system free from unwanted mails.

Hallo Stephen!

SM>but does anyone know if similar extensions exist for the
SM>Jaguar/Enhanced Joystick ports on the STe and Falcon.

They do. These are the same connectors as on the VGA-Port (15pin SUB-D), and
for those there are extensions available. Just scheck they have male and female
plugs, or get a gender changer.

>

Okay i did a little more investagation on my 1040, i pulled the sheilding off (well mostly), and yes the 4 meg board is populated on the top, but underneath it is not populated. what kind of chips should i put in the bottom section to fully populate it? also as for the memory chips on the 1040, they are all there, does that mean i still have 1 meg on board or half of them disabled? where is the best place to find the chips that the board requires? i occasinolly will pickup odd boards here and there, like old memory upgrades for old ibms, video cards with socketed memory chips etc. wheres the best place to find that kind of chp?

Also i discovered something else, that toggle switch goes to a ICD ADStart chip on the main motherboard, as far as i can tell, it is an accellerator of some type. Can somone give me some more details about this accell?

Thanks
Bo

Well the TT has a localtalk Lan port (the same as an Macintosh localtalk
port). I was wondering if i could do some sort of a connection between my
powermac 6500 and the TT and browse that way.

Its probably an ICD Adspeed accelerator, or unlikely but maybe an ICD SCSI
Host adapter (dont remember an internal one being made though).

The ICD website seems to have been deleted though there are quite a few hits
in google for "atari ICD Adspeed", but as its late (early?) im not gonna
trough thru that lot, i'll leave that upto you.

BTW, Atari rip-off-shop
(http://www.atari-workshop.co.uk/products/accelerators.htm) list the adspeed
at £90, whether they have one or not is another matter.

Smeg.

Smeg,
Yes, 525 is a sound converter for the Atari that
works on almost ALL sound file formats except MP3's.
To convert MP3's to WAV or other uncompressed audio
format you need ANIPLAYER. I have a copy of 525 in
english if anyone needs a copy. Just let me know via
e-mail and I will send a zipped copy to anyone who
needs it.

Thanks,
Carey Christenson

Bo,

Its a 16mhz accelerator by ICD. There is some software to go with the
accelerator. Ill look to see if I still have a copy.
Looks like you find a really winner at the thirft shop.

Don

Well it might be a cool winner (and i am downloading a bunch of stuff so that i can try it out on that mode, apparently the TT030 i got too isn't that good for playing games), however i did a stupid thing when i was taking it apart.

I accidently broke one of the keys (the little white thing underneath the key, the actual part that pushes up and down that the keycap attaches to). My cat knocked it over while i was busy with the comnputer itself. So if anyone has a busted ST keyboard that they use for parts, i only need the little white thing underneath the keycap, that they would like to send (i will pay shipping and whatever of course), that would be greatly apprecatied.

I will take a photo of what broke tonight when i get home so people can see what broke on mine.

Thanks
Bo

been there done that! was it the help or undo key? does not matter all are
the same anyways. Its a bit of work to replace that part, about 30 small
screws hold the keyboard together.

Email me your address I'll through one in the post for ya

Its a bit of work to make that board go from 2 to 4 megs but I'd think that
any 1meg dram faster then 120ns will do for chips. I think you need to cut
some traces on the main board to make it see the other 2megs. Yes your 1040
has a meg of memory in it, Its arranged in two banks of 512k. The install
the z-ram board switches/disables 512k from bank 1 and uses the 2megs on
the z-ram board. So now you have a total of 2.5 megs of ram available. I've
never owned a 1040 or a zram board so I could be wrong here. Anyone have any
instructions for this board?

Here is a link to the part that i broke:

http://www.ynwi.com/~lysol/jesda/atari/broken1040key.jpg

The middle peice is what broke, and the peice on the far right is the good
one. It was the F2 key and it looks like i boogered it up good by trying to
glue it together as you can see.

Without trying to diminish the benefits of Popwatch, etc. I would like
to notice that Newsie, as well, can delete mail without retrieving
them first. In "Get selected mail..." one can get just message subjects
and then decide whether to retrieve the messages themselves or delete them.

Use an Atari emulator (Steem or Gemulator) for your PC and run 525 on this.
You can read Atari discs with Gemxplorer (same site as Gemulator).
I don't know any native PC Sample editer that can read AVR. But you can try
to import it in Cool Edit (www.syntrillium.com) as a 'raw' file. You have to
know the bitrate (8,12, 16) and samplefrequency (22, 44.1, 48 KHz) of the
sample. Otherwise it will sound like noise. If you import the raw file, Cool
Edit will ask you these information the first time and you'll have to choose
the Motorola format too.

Cheers,

Jos

Just tried it and it works with 16 bit AVR-files in Cool Edit 2000. Once I knew they were 16 bit, 22.5 KHZ it was no problem reading them. By opening a file just select all file formats and you will see the AVR's.

The Cool Edit 2000 demo is fully functional (though not all functions at once) and you can save ev'rything during the first month.

Cheers,

Jos

Hi Djordje,
Even with "Get selected mail" Newsie does have a problem there too that
may be related to a long file name in the subject line. For me, the best
way to delete that file on the server is through my ISP's mail web page.

I used to frequent this newsgroup, but have been away for ~6 months. Where is everyone? There used to be loads of posts a day, now I see about 20.

Is there a new forum everyone has scarpered to, or have they all bit the poisonous PC bullet?

Smeg.

Hi Bo!

Many early 520s had only single-sided drives and some have had a switch fitted that allows booting from an external DS drive (in fact Evesham fitted one to my first 520 STFM while upgrading it to 1 MB the hard way - soldering in a second bank of chips, for which room was provided on the board as it was shared with the 1040). This double-pole switch is connected to pins 19 and 20 (?) of the Yamaha sound chip at right rear of board.

However I think all 1040s had DS drives, so it could be that a later set of TOS chips was fitted and you can switch between TOSs - useful for some games which prefer TOS 1.00 or 1.02.

The third possibility is that it's meant to restrict memory to 500 KB or 1 MB - again, some games wouldn't run with more, though there is a software solution for this.

Another possibility is an upgrade to a high density drive, with the switch restoring double-density working. Not normally needed as this too can be done with software.

Or it could be used to select some other hardware add-on that's been fitted - again, some games may not run with it active.

As has been suggested, use SYSINFO or PROFILE, which will tell you a lot about your machine - at least those things it's able to detect and understand.

How many wires go to the switch - is it single- or double-pole, change-over or on/off, and what is it connected to? With my relatively slow computer, and paying for on-line time, I don't feel like downloading enormous illos; others may feel like that too, so it would be a courtesy to pack them or reduce them in some other way.

Regards, /Peter/

What size of images did you have problems with? I have loaded
many of various types and never ran out of memory on my 4 MB STFM!
But I guess some highly-compressed JPEGs become too big for the STFM
when decompressed for viewing - nothing to do with Imagecopy, just a
memory shortage!

Hi Michael,
It depends what computer you have and how you're running your programs.

If you run from floppy and have an STe you can click on the program file, go up to the Options menu, select Install Application and click on Auto. Then save the settings in your Desktop.Inf file. This will automatically load the file at boot up (starting the computer with the disk in the drive). If you have an STFM you may need a program like Gemstart or Headstart to autoload a file.

If you want to have an intro screen when you start the disk, you can put a program like Bootinfo in your Auto folder, which allows you to display a simple text file on your boot screen for up to 30 seconds (or until you press a key) indicating what files are on the disk.

Alternatives to this include using a small boot-up utility like Zapenu, which let you have a menu of programs on the disk from which you can select.

Finally, you could "pack" the file and have a text message come up on screen while it's loading and unpacking.

Take your pick...

I have had the same problem and what happened to me was there was
something wrong with the email Newsie or Mymail was trying to
download. I would run MyMail and get a list of the email on your
server. Then delete the first one on the list because it it
downloaed first and see if you can get the rest.

Carey,

I think it may be a bug that should have been fixed. This sometimes happens to me. I usually fixed it by deleting the whole cache and restarting Cab. Sometimes Cab will bomb when trying to gety on certain websites or even tell me the site is no good and cannot be found. I can usually get (about 90% of the time) by deleting the cache and trying again. Thing have been better since I setup Cab to write the cache in a Ram disk. Things happen now and then, but for the most part everything is fine.

Hi Bo!

Many thanks for your detailed reply, but, having read all other replies
and having a sudden remembrance of the same problem several years ago,
I remembered that my first outmail may be corrupted. I examined the same
first outmail and, of course, it *was* corrupted. Hence I deleted it.

Result: NEWSie faultlessly gave me my emails this time...

>Goto www.mail2web.com and sign on to your email account (this is a webmail
>program). That should bring up your list of emails that are on the server.
>Go though them and delete all the spam and everything of that nature. If
>you can, read the emails while on mail2web.com and delete them. ONce they
>are all deleted, THEN reopen the email program that is crashing and check
>your mail. It should work then.

This procedure will be be carefully saved for future problems. Thanks!

Regards,
Charles.

(Also using TT030: CAB 2.7; NEWSie 0.961; etc...)

I have 2 Zubair Z-Ram mod boards with 4 meg on them..(I think,ithas been
a long time since they have been used , but both sides are populated with
ram) along with the instructions for installation .One was in a 520 and the
other in a 1040. I also have a 16 MHZ accelerator mod but no instructions -
it says fast technology on the circuit board. Anybody interested in them
please e-mail me.

Personally, I'm getting tired of everyone ragging on Ben Smith (Bravo Sierra). Ok, so his little ADV: posts are an anoying read. But it is nice to know there are still dealers out there that want to get involved with the community. My own personal experiences with Ben have been satisfactory. He's a little slow at times, but he does know his inventory.

What I'd like to see, is the few remaining dealers get together, and post a single article with a link to their sites. Let this get posted monthly.

Or maybe they could post an article occasionally, with a link to their site in their signature. If I were running an atari business, I'd do this, as it can add to te community and get your advertising across.

As to this business about them making money selling atari wares, I can almost guarantee that there is not enough of us to sustain a business.

Well, I think he actually has a right to post crap, but not if it's hurting other and he clearly does. I think one should be able to post piss posts if you want, but not something that put someone else in a bad spot. At least have a good reason, like if Ben ripped him off or something, but then he should just say so, not put up this crap with fags and stuff. And lastly, be a man (or woman) and stand up for your opinions, not hide like a chicken shit!

I'm here,

Owner of, Atari TT, Atari STE, Atari Lynx, Atari hard drives, all Atari laser printers and most Atari monitors. Still looking for a falcon though, its avoided getting into my hands for many a year!

I'm more of a collector, I rarely ever use the items in my collection, only maybe once a year to remember how to use them.

keep enjoying the platform.

he provided for virtually nothing.

Nevertheless Harry, it is the correct terminology.

Others have lost more, there is no scale for 'Thief', if you deprive people
of their lawful possessions then you are by definition a thief..

Paul Glover stole my money.

The Okami version of today is far more easier to setup then the version of
some years ago. I must admit though Okami is still not that easy that one
can fire up the program without studying some docs. But once setup it
really worth the pain.
Because my Hades is down for the moment I'm forced to use a pc program for
reading usenet. So far I haven't encountered a pc newsreader that give me
fully satisfaction like Okami does.

CU,
Martin

Try "Marcel" available on some ftp sites. Its free and should work
well on a 1 meg atari.
Atariworks is another one that is good. You won't get a lot of fonts
with 1 meg, and you would need Speedo Gdos or NVDI anyway.

Message-ID: <50cabf78.0303150732.121360f@posting.google.com>
Source record: 28822

Does anyone know of a good program for copying Atari disks to CD for use on either a CD enabled Atari or with an Atari emulator on a PC. I have a couple of hundered disks from an old Atari club that I would like to archive to a CD. The disks are all shareware that was originally collected by MilAtari here in Milwaukee.

I recently built an All-In-One Atari in a PC case and added a CDRom drive. It was mainly a project to see if I could do it. The Atari works great.

Any suggestions and links to a good program would be appreciated

Dave Glish

I managed it, so it can't be /that/ hard :-)

I still prefer Emailer though!

Lyndon had a useful archive on his web site for setting up Okami BTW, and I
also understand that current versions are easier to set up anyway.

Cheers

Derryck

Wow, a reply!

Thanks for trying to help, but unfortuanetely I think the Jag version of Zero-5 is pretty much an entirely different game to the STE version, because the developers upgraded it so much to take advantage of Jag hardware. But it's just possible that they kept the same controls... Could you have a quick look through the manual for me, see if there's anything that will help? Thanks.

The fines over here are fairly high, but whats worse is that its really easy
to lose your licence if you ride a bike.
Anything over 100mph or if you accumulate 12 points its an automatic ban.

Smeg.

100mph, that would most likely put you in jail in this country... 35km/h
over the speed-limit, and the licence is lost for 8 months. I was doing
32km/h over the limit.

Well, what type of mouse have you got and where are you plugging it?

It needs to be a Bus mouse (very old) and plugs into port 1 under the ST.

If you got that right, it'll work - if not, make sure you 'do' have a Bus mouse and it works.

Dan.

Thank you very much.. I will have to get those images a little later when i am at work. My isp at home prevents downloads greater than 180 megs in a 4 hour peroid (i have direcpc) and if i download more than that, my connection gets throttled down to about 20kb-30kb (less than a bad dialup connection).

Thanks again though,
Bo

>> speaking of) require busmaster DMA to work. So the PCI bus adapter must

Aren't there still a few cheap NE2000 compatibles around?
IIRC, those don't need to be bus masters.
(I'm reasonably certain it was an NE2000 that Sven (the Eclipse designer)
wrote some kind of Eclipse driver for.)

> Yes, a PCI Adapter without busmaster capabilities is a dead PCI adapter.

The whole point with PCI is indeed to use bus mastering and burst transfer.
Without that, you will often end up transfering data at less than 10% of
the theoretical maximum speed (and you will of course tie up the CPU).

>This is the very reason Eclipse is useless with 99% of current PCI cards!

The Eclipse was designed to be used with a graphics card, and was sold
as such (just like the NOVA boards, which were really ISA bridges, IIRC).
I'm not aware of any PCI graphics cards that really _require_ bus master
support.
The Eclipse is also limited by the 16 bit Falcon bus to a bandwidth even
lower than the 10% mentioned above.

Still, bus mastering could have been somewhat useful. It would probably
have been a bit painful to implement, though, since the PCI bus is twice
as wide as the Falcon bus, and several times faster.
On burst writes, it would have been necessary for the PCI bridge to do
a 'disconnect with data' after a single 32 bit word was transferred
(since the bridge would need to access the Falcon bus 16 bit at a time
to write the data).
No burst read could ever get more than one 32 bit word, and the bridge
would likely need to answer with 'retry' first to give itself time to
fetch two words over the Falcon bus.

I believe it would have been possible (with a larger CPLD and thus a
more expensive board (and of course, more work)) to get some kind of bus

master capability on the Eclipse. The performance improvement would
likely have been quite small, but it might have enabled the use of
soundcards and ethernet cards, for example, to some degree.

>A PCI solution for the ct60 MUST be a 100% complete PCI implementation,
>else it will be useless.

Anyway, this is not a problem since at least one free bus master capable
PCI core is available. See www.opencores.org.

PCI bridges like the PLX9054 etc aren't really very expensive either.

The 'only' problem is building the board.

Hi,

I think this might work, I haven't tried it....

Create a Papyrus doc with an image in the desired folder called
A.IMG for instance.

Using Cubase print the file to the folder overwriting the A.IMG
file.

When the PAP document is opened it will show the new image.

With Multitasking, OLGA might make this even simpler by updating
the Papyrus document while Paprus is running. I'm not sure about
that bit.

Worth a try.

Regards,

Peter

Hi,

I just picked up a 520STE at carboot sale for £1!

Just the 'puter.. no leads or anything. I didn't really expect it to work, but surprisingly it is showing signs of life.. I could do with some help to nurse it back to full health though.

It powers up and checks floppy drive ok.. then maybe 50% of the time, the GEM desktop appears, and for a few minutes I can move mouse pointer, access menus etc.. Then the screen goes black, and the floppy disk will click and whirr... If I leave it, the screen seems to alternate between white, fading to black.. then suddenly white again. The change from white to black seems to coincide with the floppy drive being accesssed.

If I switch off, then back on it will usually be ok again.. for a while..

I've opened it up and pressed down on all the socketed chips I could see (2 under floppy drive and 1 square chip in big big recessed socket to the right under the keyboard), removed & refitted the memory simms, which seems to have made it run a little longer before dying, but it still isn't very happy.

I'd love to get it working so if anybody could suggest anything I'd really appreciate any help.

Cheers!
Norm

That is a good mystery. First, check the power supply voltage with a digital voltmeter. Low voltages can cause some really strange things. If the power supply works at all, which it does, there is a capacitor that looks like it has had to much to eat on it, and is probably leaking, if not dripping its insides out. If a capacitor does not look pretty, for a first cut, replace it.

The floppy runs off 12 VDC, and that load should not cause anything else to happen, unless the power supply is defective, and the 12 v load pulls down the 5 v line.

From the symptoms and the power supply circuit diagram (typical) you need to replace two 470 uF capacitors.

Check the voltages first.

Jim

It won't work, the Nova ISA-adapter only works with the graphics card.
It's made specifically for this. You can get a Panther II ISA-adapter
though, this has two ISA-slots and will work with both a graphics card
(ET4000) and a ethernet card (NE2000 IIRC).

I had a similar problem when I soldered a 4MB stick of ram in my ST. (I labled the data lines wrong, which meant the system couldnt access the memory banks).

In your case, if its not the power supply, I reckon the memory connectors have a bad contact, which get worse as the system expands to heat.

Try diff sticks, swap the order or just abraise (sp?) the contact pads on the ram with a little wire wool.

Dan.

Hi

I got the exact same problem some 10 years ago, but due to the pin of
the mfp68901 used for monochrome detection. It had most probably been
electronicaly damaged after many hot pluging-unpluging sequences on my
TV. After some minutes, when the chip got warm enough, it started
switching by itself from colour to mono indefinitely.....which drove the
ST into a reset loop where the screen turns to black during reset, while
white a few seconds later, til the next reset ! I had to have the chip
replaced.......

I would bet on that reason in your case !

> I would bet on that reason in your case !
>
> Fred

Thanks! I'm going to try everything that everyone has suggested. I'm not any kind of electronics expert, but somehow your description seems to match very closely what is happening with my STe. Especially as I've discovered another problem connected with screen resolution.. If I switch from low to medium res, the ST often (not always) freezes for 5-10 seconds while floppy drive whirrs and clicks.. Then it will either switch to med res, or will go into the black -> white screen reset loop.

Maybe a coincidence..?

Do ST's usually access the floppy-drive during a change of screen resolution? I don't remember mine doing this (though was long time ago).

Thanks!
Norm

Thanks.. I'll try this.. I think I've even got some spare Atari Simms
somewhere so will try different ones in case the memory chips might be bad.

Really want to get this working.. I'm quite excited to have an ST again! I
Always regretted selling mine.

Thanks,
Norm

Thanks Jim, Just looking under the sheilding, the capacitors look ok.. None of the leaking and dripping that you described. I'm going to check the voltages tonight after work. From what you say, I think you're right that the floppy shouldn't drain enough power to crash the system.. I guess it's a symptom rather than the cause of the problem.

I have to admit I'm a bit nervous about replacing anything that involves soldering, but I might have to get my hands dirty this time! I don't want this ST to end up stuck in the back of a cupboard.. Really want to get it working!

No doubt I'll be back with more questions after I've tried everybody's suggestions!

Thanks for quick response!

I sell a SCSI Scanner for Atari.
http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=11207&item=3407501841&rd=1

1384. Sell: Falcon with Afterburner040 & Nova Graphics Card, Tower

Newsgroup: comp.sys.atari.st
Date: 2003-03-17 11:17:50 UTC
From: bkx@gmx.de
Message-ID: <1dcdfbae.0303170317.3d9228cf@posting.google.com>
Source record: 28764

I want to sell my Falcon:
With:
Afterburner 040 @ 32 MHz and 64 MB FastRAM (full 68040 mith fpu and
mmu)
Nova true color graphics card 2 MB DRAM 800*600*32 bit (True color),
1024*768 16 bit (High Color)
50 MHz DSP
4 MB ST-RAM
TOS 4.04
Clockpatch
60 MB IDE
2 GB SCSI
built in a MIDI Tower with internal and external SCSI, external
ROM-Port, PC-Keyboard Interface
12x CD ROM
4x CD Burner
270 MB Syquest with 4*270 MB discs
external 650 MB PD (optical Phase Changer) with 3*650 MB discs
All together with software, mouse, keyboard.

eMail me and tell me how much you want to pay.

Maybe a 15" TFT Display thats works fine with the Nova.

I have also many software, books and other atari hardware, please ask
me.

Does someone want a Steinberg digital interface for falcon? Together
with Cubase Audio.

I live in germany, europe. So please tell me how much you want to pay
in Euro.

regards
Benjamin

You cant plug flowers into the mouse port, they just wont grow! :-)

Soz.

Err, if you have an Atari mouse (some amiga mice have a switch on the bottom
saying AT/AM so you can use those) then you just plug it in under the
keyboard and it will work straight away without any drivers. If you havent,
but you have a PC serial mouse lying around, plug that into the serial port
at the back, and run genmouse.app off a floppy and you should get it to work
that way. Search the net for genmouse and you will find it.

Hello there, thanks to the generosity of Clayton Murray, I have been able to photocopy the manuals for Logic Audio Falcon. The manuals are mostly oriented to the Mac, but apply to the Atari version as well. If anyone is using this program, and needs the manuals I have a couple of photocopied versions that I will mail out. Of course you need the dongle to make this program work. This is the manual for the Audio part of Logic only.

A change in resolution (whether between mono and RGB monitors, thus changing the state of the monitor detect pin, or between medium and low res using the options menu) always causes a full reset of the machine, and this of course includes checking to see if there's a disk in the floppy drive.

So, if you've got a res-changer button on your monitor lead (and no sensible ST owner shouldn't, or you'll wear out the socket in no time at all) make sure you've saved anything you've been doing before pushing it!

You can connect a most S/VGA monitors to a Mega/ST/E [IN MONO ONLY!] without having to trim the monitor (from inside!) but some will require it (usually the vertical and horizontal size needs expanding a little). However, because the horizontal timing on the ST is 15.75Khz and all VGA monitors (except the really old ones) wont sync lower than 31.5Khz you wont be able to use a VGA monitor with the ST in colour. If you can find an old monitor (NEC 2D, 3D etc spring to mind) then you will be in luck. There is a schematic around somewhere, I think its just a question of wiring the RGB lines straight up, then the syncs, and have a switch has two purposes 1. pulls the monitor port pin (13?) to ground which will reset the ST and set it into mono mode. 2. connect the mono signal at the ST's Port to the RGB inputs on the monitor.

Should be quite easy to do. (he says, never actually having done it...)

Since ST High is mighty close to VGA, it is fairly easy to get ST High
on a VGA monitor. If you want color, you will need a scan convertor
of some type. Using a STFM or STe's video out to a video -> VGA
convertor is probably the simplest way, although you lose some
clarity.

You can write ISO9660 disks on CDWriter by Anodyne Software, among
others. You can keep the data in TOS-ready form or convert them to
.ST or similar files for emulation.

Try www.anodynesoftware.com.

I've been pondering Laurent's Eiffel card for using PS/2 mice and keyboards for a while. Unfortunately, 3 emails to Laurent haven't received any response. Since he was kind enough to release the drivers, it is mostly a matter of building a simple board (which can even be done on a breadboard) and programming a single chip. Unfortunately, I don't own a EPROM writer, and I note they are around $60 US. This seems a bit much for me to buy for a single use, so I'm wondering...

1) Is anyone willing to build Eiffels?

2) Is anyone willing to burn EPROMS on their equipment?

3) Is anyone willing to purchase EPROMS if I go to the trouble of purchasing and learning how to usee the burner? (I doubt it's difficult, but I really don't know for sure).

Eiffel uses a PIC processor, somewhat different to an E(E)PROM.

There is a link to a simple PIC programmer on the Eiffel web page that
works via the serial port under ANY platform which I'm sure will work
quite well, since the actual compiled code is supplied with the Eiffel
archive?

It should be quite easy to build the programmer on a breadboard too, but I
would recommend not using a breadboard for the adaptor itself. Better on
the PCB, or maybe stripboard with all unused sections of tracks isolated.

Cheers

Derryck

You can try http://perso.wanadoo.fr/didierm/files/pic_dev.zip
but you need a 68020 or more (tested under falcon).
Inside the archive there are gputils (assembler) and prog84
(programmer).
I use this tools for the Eiffeil card.

Regards,

Didier.

Fortunately this isn't the case when switching between low and medium
res. A low/medium <-> high res change will perform a warm boot so
everything gets reloaded.

When changing between low and medium res, GEM is re-initialised and this
means reloading any desk accessories and the desktop.inf/newdesk.inf
file. Any auto-folder programs that remain in memory are still there
after a low <-> medium res change.

>and this of course includes checking to see if there's a disk in the
>floppy drive.

My experience was that the floppy was read only if the ST didn't have a
hard drive, or the desktop was saved with an open window for A: or B:

please note, if you're trying to connect to my ftp site and it appears
to 'hang' just after entering your username (of anonymous) then try
PASSIVE mode.

You may need to select PASSIVE mode in both your ftp client application
AND the operating system

WindowsXP and MacOSX users may need to disable the firewall within the
OS... though this i cannot confirm 100% as i'm using OS9!! (but this HAS
worked for other people). This is because my ftp server is behind a
router/firewall, apparently!

1406. Lemmings II - save disk problems - HELP!

Newsgroup: comp.sys.atari.st
Date: 2003-03-18 19:23:28 UTC
From: Tom McEwan <tom@tnmcewan.fsnet.NOSPAM.co.uk>
Message-ID: <b57rnj$14l$1@news6.svr.pol.co.uk>
Source record: 28788

Anyone else have problems saving and loading games in the STE version of Lemmings II - The Tribes?

I'm running it on an STE fitted with a low density drive, and sometimes when saving or loading the drive makes unpleasant crunching sounds. I've run the machine with the drive cover off, and it turns out that sometimes the disk head is actually trying to go past the end of the disk and is hitting the spindle in the middle! This only happens in Lemmings II, all other games are fine. We've tried doing what the hackers do, and making a custom disk image with extra tracks and sectors, but it didn't help.

Any suggestions?

I've heard from a friend that the Mac version has similar problems..

>

I remember having this "Initialising Link" problem with my isp (Freeola) and
I cannot remember what the solution was. I remember that they improved the
security at one point and I discovered that I had PAP_PASSWD instead of
PAP_PASSWORD so I could not connect.

Have you searched this group on Google to find any reference to the "Initialising
Link" problem ?

Are you using FETCH_DNS ?

If you decide to use PAP instead of a login dialogue then make sure you leave the
DIAL_SCRIPT line at the end of the DIAL.SCR file.

Also, have a look at the scripts on my website for Freeola, they may give you
some ideas.

Just tried here with no luck using passive mode. Neither Atari Aftp or
Win WS-FTP managed to list your directory. Both did connect and log on,
though.

WS-FTP timed out after some time but Aftp not. Had to kill the process
but got the "Fatal error in GEMDOS" error from Magic as a result...

>You may need to select PASSIVE mode in both your ftp client application
>AND the operating system

The OS has nothing to do at all with ftp passive mode. It's simply
another way of connecting in the ftp protocol.

Running a ftp server under OS9!! That's really exotic.

Does this mean you are using the old Atari OS9? I guess not, but OS9 did
survive and is nowadays mostly used for handling realtime applications,
if I'm not misstaken. On what hardware does it run?

I guess your server is behind NAT as you mention a "router/firewall". The
likely reason I could not get the directory listing from your server is
that I'm behind NAT as well with both the Atari and pc. I also tried to
forward all incoming traffic except port 80 to the pc but without luck.

Hm, I recall I have the NAT-box setup to block all incoming traffic on
port 21 to avoid attackers to take control over it. I suppose thats the
reason I can't use your server...

yikes! that is bad :-(

> The OS has nothing to do at all with ftp passive mode. It's simply
> another way of connecting in the ftp protocol.

well, the reason i say this is because i've spent days with many
different people over the passed few months with hundreds of emails
flying back and forth and it's usually all trial and error in getting
their computers connected! But the ones that had the most troubles where
always the same kind really - XP, OSX and certain ones behind their own
routers/nat firewalls.. People on a direct connection, or those using
older OS's like MacOS classic and Windows95/etc seemed fine.

I know a few users that could never connect using the default active
mode or even when trying passive mode.. but when they disabled the
firewall built into their OS, everything was fine! I dunno why - maybe
these machines needed this to work? Or maybe they could have just opened
ports 20/21 and 3000-3150 (my server uses these ports for passive
transfers) at their end would still work???

One guy is on right now and has (GRR) made around 8 different
connections and is downloading like crazy! So i know the s/w here is all
fine.. (i've had around 50 ftp users since around the time i posted the
last msg in this newsgroup)

> Running a ftp server under OS9!! That's really exotic.

Hey! we can't all afford new mac's! ;-P

> Does this mean you are using the old Atari OS9? I guess not, but OS9 did
> survive and is nowadays mostly used for handling realtime applications,
> if I'm not misstaken. On what hardware does it run?

Atari? Nope, Macintosh here matey. Actually the server runs under OS8.6
and is very fast, it's not bad for an old Power Mac 6500 / G3 running an
FTP, web and proxy server:-)

> I guess your server is behind NAT as you mention a "router/firewall". The

> forward all incoming traffic except port 80 to the pc but without luck.

Yep, nat firewall here.
My ftp ports are obviosly open here - port 20/21
And for passive mode connections, the server s/w uses ports 3000-3150.
so these are also open.
I dunno if this is something only the server machine needs to open, i
doubt client machines need this also??

> Hm, I recall I have the NAT-box setup to block all incoming traffic on

> reason I can't use your server...

If you ever get a mac, then take a look at IPNetSentry - i also have
this as a backup running behind the router's firewall. Make's the Mac as
safe as possible imo:)

Can't help you to solve the problem, but the cause *might* be that
the disk has some sort of copy protection on a very high track
number and you get the symptoms you describe when it checks that
the disk is an original. On some drives, it should be possible to
file out the slot of the head carriage so that it goes in closer
in - i.e. to a higher track.

I know there is a PD program that checks how many tracks your
drive can access. Unfortunately I don't recall its name :-(

Hi David,

DB>My experience was that the floppy was read only if the ST didn't have
DB>a hard drive, or the desktop was saved with an open window for A: or B:

With standard TOS the check for the floppy is always before the check for harddisk and before running the auto folder programms. Also if there is an executable programm in the bootsector, it is executed before the harddisk is read.

Johann

Far as I know it's closed source, only seti@home themselves release binaries. Otherwise someone would have ported it a long time ago. ;-)

I'm not sure if that could be it. The program disk works fine, it's the
separate save disk that does it, and I would expect the system to be
compatible with any standard disk for storing games, so you can save as much
as you want. But thanks for the suggestions!

Even if you did you would have to run it on a TT or an accelerated Falc, or have a row of about 50 ST's running it at the same time to even start chewing thru data packets. I figure a 8mhz 68000 (no FPU in an ST dont forget!) would get thru a data packet in about a week. Maybe.

Smeg.

My old imac averages just over 18 hours per WU, and the sgi o2 r5k@200 mhz I
just picked up is in the neighborhood of 35 to 40 hours per WU. If you ask
the seti people to support Atari they just reply back the machine is to
slow without giving any figures. There's a guy listed on the Atari Team
with an average of 70 hours per WU. Makes you wonder what he's using and how
old is it?! It would be interesting to know how an 060 hades or milan
running flat out would do at seti. I'm not saying the 060 would be a good
choice, it's probably not gonna be that good at it, but it would be nice
to have some figures. ;-)

This only occurs when there is a reset. When changing between low and
medium resolution, there is no reset and so this check doesn't occur.
Changing between low/medium and high resolution will cause a warm reset
to occur and so the executable-floppy-in-drive-A: check occurs.

Crikey, I have nearly broken 800. I have about 12 machines on it tho. It helps when you have 15 machines to administer. I have actually got 3 machines that just run Seti. Anyhow, what is this team atari?

Source record: 28709

When I first found out about SETI@home... well before it was up and running as a project, I asked about the possibility of a client app for the ST series of computers.

The project's reply was that they did not have the manpower or hardware necessary to support all of the different platforms.

It wasn't until I mentioned my willingness to supply the hardware for development (once the project was up and running) that they said that it would simply be too slow to make developing a client app for the ST feasible.

I also asked about the possibility of supplying the source to a trusted programmer for the purpose of converting it to run on the ST line. The source code is not available... period. They simply cannot give out the source code if they want to maintain the integrity of the data returned, and the project in general. I can understand this... I don't LIKE it, but I understand it.

My guess about the amount of time it would take to complete a SETI@home work unit is a bit higher than LP's.

Just doing a thumb-nail sketch gives me a figure of around a month to complete a single SETI@home work unit. This is NOT taking into account the widely held belief that there are timing loops in the code to make sure that units are not completed too quickly (I don't believe that there are, or that there are other reasons for the "loops", but there are many who disagree with me), but is based upon my comparison of other types of mathematical apps (defining Pi and checking for prime numbers) between ST and a 366 MHz Pentium II. My figure also takes into account that the ST version would be multi-tasking friendly and would leave you with sufficient CPU cycles to make the machine usable. It would be possible to shorten the work unit completion time by making it single-tasking, but that would tie up the machine completely.

My 366 MHz Pentium II completes a work unit in about 18 hours, by the way.

It's still a very cool project, and I'm proud to be a part of it... and even prouder of the people who have joined TEAM ATARI.

TEAM ATARI has so far contributed more a hundred years of CPU time to the cause, scouring more than 100,000 work units for a non-natural extraterrestrial signal.

Sure, it'd be cool to have the first documented signal from ET be found by an Atari, but it'd be just as cool if the signal was found by an ATARI USER... even if it was while using a Mac or a PeeCee.

<Shameless Plug>
If you're interested in joining TEAM ATARI, go to:
http://setiathome.ssl.berkeley.edu/stats/team/team_21046.html
and take a look.

You can read about SETI@home in general and download the client
applications at:
http://setiathome.ssl.berkeley.edu
</shameless plug>

Well Team Atari is of course a group of Atari freaks who are interested in
seti@home, but because there is no Atari/TOS client we are forced to use
a peecee or mac.

Currently there are 57 members.
Click this link for Team stats, you might recongnize some of the names. ;-)

As a member of Team Atari, but using a (spit! Spit!) Contemptible. I started S@H on a P 1 133 box, with 48 Mb EDO RAM. It took between 95-100 hours for each WU, under Win 95, on the first and second releases of the GUI client. Turning off the screen saver dropped it to 45 hours. The third, and current, release of the GUI does much more calculation, and increased the time by at least 50%. So, I guess this will give you a bench mark for the 70 hour per WU guy.

18 hours per WU on an IMac is not bad, when compared against the times reported for G4s.

For a Mac that will really crunch WUs the new dual proc G4s, running at 1.5 Ghz and 1.26 Ghz look very interesting. Any thoughts?

LP,
I would imagine that an accelerated Falcon with the
new CT60 would be able to do much better than that 70
hour per WU. He has to be using some old Pentium I
processored peecee. Maybe a Pentium 2 but I would
think that unlikely as long as that is taking. I have
heard that the 060 running at 72 Mhz. is comparable to
a PowerPC running twice the Mhz. and that a PowerPC
running at lets 150 Mhz is comparable to a PC running
at twice that speed somewhere in the neighborhood of a
300 Mhz. Which is probably better than what that guy
is using that runs that 70 hour per WU. I think SETI
is just lazy and does not want to port over there code
to a machine that is not supported by big companies.

Just my 2 cents.

Thanks,
Carey Christenson

Agreed , in my case it was about £20, after tax this took me about 4 hours to earn honestly, and I was very angry when duped into sending it, we know a name and an area and maybe the PO box could be traced, of a look on the UK info disk would reveal his home address. If someone walked up to me on the street and took £20 out of my pocket you could guess my reaction.

Paul Glover is every bit a THIEF without the decency to let people know, in it's heyday I'll bet the FA ST club was a nice little earner, but like a few others I could mention he has just scarpered, The only ones who did it all properly where The Floppy Shop, they let folk know, had a sale, and made a memorial site, true caring dealers

Dunno if this helps any (I'm not too clued up on this) but...

<bash a>
$ ftp ftp://massiveftp.serveftp.com
Connected to massiveftp.serveftp.com.
220- MASSIVEftp.serveftp.com
[snip]
220 Service ready for new user
331 Guest login ok; enter e-mail address as password
230 Guest login ok; access restrictions apply
Remote system type is MacOS.
200 Type set to I (Image)
250 CWD command successful
</bash a>

<bash b>
$ netstat -anf inet
Active Internet connections (including servers)
Proto Local Address Foreign Address (state)
tcp4 80.4.128.29.1318 217.35.1.167.21 ESTABLISHED
[snip]
</bash b>

...it logs in okay and I have port 21 established. Problem arises here...

<bash a>
ftp> ls
227 Entering Passive Mode (217,35,1,167,128,126)
ftp: connect: Operation timed out
</bash a>

<bash b>
$ netstat -anf inet
Active Internet connections (including servers)
Proto Local Address Foreign Address (state)
tcp4 80.4.128.29.1319 217.35.1.167.32894 SYN_SENT
tcp4 80.4.128.29.1318 217.35.1.167.21 ESTABLISHED
[snip]
</bash b

...where the above "netstat" got typed in between "bash a" entering passive mode and it timing out. Sooo, if I haven't made a mess of that bit then it clearly shows my end never getting a response from your end. Note that I cut the "Recv/Send-Q" columns to keep the columns formatted - they were all zeroes.

Repeating, this time via a machine using NAT yields similar results...

$ netstat -anf inet
Active Internet connections (including servers)
Proto Recv-Q Send-Q Local Address Foreign Address (state)
tcp4 0 0 192.168.0.16.2224 217.35.1.167.32903 SYN_SENT
tcp4 0 0 192.168.0.16.22 192.168.0.1.1342 ESTABLISHED
tcp4 0 0 192.168.0.16.2223 217.35.1.167.21 ESTABLISHED
tcp4 0 0 192.168.0.16.22 192.168.0.1.1341 ESTABLISHED
tcp4 0 0 *.587 *.* LISTEN
tcp4 0 0 *.25 *.* LISTEN
tcp4 0 0 *.22 *.* LISTEN
tcp46 0 0 *.22 *.* LISTEN
udp4 0 0 *.514 *.*

Now I'm lost. I dunno any passive ftp details. Hopefully someone else can explain the port number discrepencies.

It's an older 400mhz imac. It seems to go faster if you keep the window
minimized, so you can't see the graphics. Seems to waste alot of time
rendering the graphs.

Sadly, I have to moreorless agree with you. I too am owed 3 issues of Glover's magazine (or a refund). I tackled him about it about 2 years ago, and was assured the next issue was almost ready to be printed - yeah right!

As one of the people behind Atari Computing magazine I would like to add that AC did refund all direct subscribers with either money or credit notes (by choice) for any unexpired subscriptions. We also gave away free to all subscribers a copy of the AC CD with the final issue.

I like to think we did things in a decent way even though we effectively ended up a bit out of pocket personally in the end.

ST Club was a business and did run things properly and fairly for many years, therefore a great shame they let things end in such a bad way.

Hi,

A while ago I rescued a 260ST and a 520ST from the trash, complete with PSU's and the 360KB external floppy drives. Problem is the TOS disks are missing.

Does anyone out there have a copy of the TOS boot disk that came with these machines, UK or US? I don't think sharing this with me would be considered breach of copyright, I would imagine that since I have the machines, having a copy of TOS 1.00 would be legal (I'm not into piracy)

Another thing I'm looking for is the original Atari drivers for the Viking board and SM194 monitor. Once again, I have the hardware but not the drivers. I tried Ralf Zimmerman's version but it just bombs out, I'm not sure if it's the driver or maybe the board is fried, so I'd like to give it a try with the original drivers.

TIA and regards,
JM

Hi, i've not bothered to quote this reply.. ;-)
But i for one! would be very interested why certain people cannot
connect.
fyi, my server sw uses port 21 and (for passive) 3000-3150 - all are
opened / enabled. I've connected to the server myself from my girl
friends PC (spit!) and all was fine - using IE5 and FilezillaFTP.

btw, using a Netgear DG814 router (juust incase that matters!) :)

Thanks

> opened / enabled.

I was a bit tired last night. Just wanted to get the details posted before I lost them. Now, refreshing my own memory, iirc there's no difference between active and passive ftp as far as port 21 in concerned because it was outbound from the client (ie my end) anyway. Active ftp requires the client to initiate a listen socket on the second ftp channel and is thus a pita for firewall administration. Hence passive ftp: some communication (the mystery pasv part) must occur on port 21 that causes this to be reversed. The server now initiates a listen socket and the client establishes a second outbound connection to it. This actually happened for both my machines...

tcp4 0 0 80.4.128.29.1319 217.35.1.167.32894 SYN_SENT
tcp4 0 0 192.168.0.16.2224 217.35.1.167.32903 SYN_SENT

...but the server at your end never replied. This is where the clients will be dropping dead.

Ah, just done it again. Helps to be awake! Look...

ftp> ls
227 Entering Passive Mode (217,35,1,167,131,170)
ftp: connect: Operation timed out

tcp4 0 0 80.4.128.249.1782 217.35.1.167.33706 SYN_SENT

...port 33706. That must be how pasv works. That is, the first four numbers are your IP address, the final two the socket...

131=$83
170=$AA
33706=$83AA

Your ftp server has doled out a port number to my ftp client that your (stealth mode?) firewall won't even acknowledge. Your ftp server works. Your firewall works. They don't work together, except by chance.

When I revert ftp to active mode...

netstat -anf inet
Proto Local Address Foreign Address (state)
tcp4 80.4.128.249.49159 217.35.1.167.33733 ESTABLISHED

tcp4 80.4.128.249.1788 217.35.1.167.21 ESTABLISHED

...no problem. Hopefully there's an option for your ftp server than has been overlooked. ;-)

I haven't been able to try it properly - can't give it a hard disk iyswim. I need an option to mount a directory as the aranym filesystem. Does such exist yet?

I think its all down to the FPU. This gets forgotten nowadays since the 386
and upwards have had an FPU included on the CPU die.

From: paul.williamson@zetnet.co.uk
Message-ID: <3e7a5560$0$257$4c56ba96@master.news.zetnet.net>
Source record: 28728

Hi all,

Just to let you know that I have received an e-mail from a
Dr. Ronald D. Thomas which supposedly contains a security up-date for
Internet Explorer users.

Norton trapped this as a virus, and a look at the file on the Atari shows
various text comments which probably confirm this - suggestions to look
at various XXX-rated sites etc.

The headers show that this has been sent to several Atari users whose
e-mail addresses have possibly been gathered from this list.

I hope this may help you protect your PC's, if you are using them - but
surely as loyal Atari users you couldn't possibly be doing that :-))
(O.K. - I admit it, I'm not running Norton on my Atari, but I am using it
to post this!)

Cheers

Paul

Yes I can vouch for that Atari Computing operated fair and square, real good guys

I can also accuse Paul Glover of dishonesty and theft, I was also a victim of the non exsistent mags, unemployed at the time I sent half my weekly giro, I could gladly throttle him

That's curious, the usual places on the net don't have them anymore.
I wonder what happened?

I have an STe, so 1.62 is all that's available here. The 1.00 disk
version is different enough I don't know if you can use it.

Sure it does. There is a BetaDOS driver for single TOS and an .XFS
driver for FreeMiNT. There is also a MiNT-Net .XIF driver already. See
the http://aranym.sf.net and than the README and INSTALL files
enclosed in the packages.

:-P
actually, there isn't m8. So i'm stuck here - quick questions, it's the
port no's right? I don't really know much about the comms side/etc but
should i try to enable more ports? :-/
The manual says ports 3000-3150 for passive...
I suppose i could try and forward your earlier msg to the mailing list
for the software. Tech support is superb u c, even if over my head!

thanks for the test! (i think) :)

Doesn't matter,

Usually it comes from other people's addressbooks on their windows machines.
i.e. the virus doesn't have it's own built in email list, nor does it scan
the net for email addresses to mail itsefl to, I always hear it gets them
from outlook addressbooks.

There is a hardware device that will allow use of a PC mouse on
the Atari. I use on my machine... Atari mice are cheap and can be
found on the web for sale.

If you can get a hold of an old piece of ST hardware called a
Video Key, you can use that and a video converter to hook your ST
up to a PC monitor. I did it and it worked fine.

Hello Dave,

The program I use on my Atari Hades is CDiso from Anodyne. It will
copy contents on an Atari computer and put it on a CD in the ISO
format that can be used/read on any machine.

CDWriter is used mainly for making audio CD's, but it make work.
CDiso from Anodyne will do a little better job in this case. I
have all of the programs from Anodyne (includes Extendos Gold) and
do not know what I would do without them.

Hello All,

Using STing 1.26 and the hardware/driver from Lyndon Amsdon, I was
able to get my STe added to my home LAN. I now can communicate
with my Hades and my wife's PC. Now I want to set up
Newsie/Popwatch to send/receive email. This way, if anything
happens to my Hades, I can still talk to world. I tried to use
Cab, but nothing on the screen came up when the particular site
was loaded. I think this is because I have an old version of Cab
on the STe and need to put a newer version on. I also want to be
able to back up my STe using my Hades and CDBackup. Kind of nice
to see it all working.

> e-mail addresses have possibly been gathered from this list.

That's almost certainly *NOT* how the address was gathered. You also may
be mistaken about the origin of the message.

What you describe sounds like a fairly common e-mail worm. Most of the
e-mail worms I've seen in the last year or two do one or both of two
things:

1) They rifle through the victim's e-mail address book to locate more
victims.
2) They forge the return e-mail address to be one in the true victim's
address book.

Thus, I hypothesize that what happened is this: Somebody active in the
Atari community, but who (unwisely, IMHO) uses a Microsoft e-mail client,
was infected by a worm. The worm sent itself to many or all of the
addresses in the original victim's address book, possibly using another
address fromm that address book as a forged return address. This
newsgroup probably had nothing to do with it, except possibly insofar as
the first victim probably obtained some of those addresses from this
newsgroup.

Believe me, I've received many of these worms. In fact, so far this year
my spam filters have tossed precisely 100 worms. Every month or two I
receive an automated or personal message from somebody complaining about
the worm that "I" sent, but I'm quite certain I've never sent such a
worm. (I don't use the e-mail programs that are susceptible to the worms
in question, and I seldom even boot the OSs in which they run.)
Unfortunately, the complaints never include headers, so I can't track
down who has my e-mail address in an address book and has been infected.

Unfortunately, it is quite possible. The latest worms appear to have
been given the ability to search for addresses not only through the
Windows address book, but also in any newsgroups the infected user has
read using Outlook Express as well as web pages stored in the Internet
Explorer disc cache.

<Snip>

>Unfortunately, the complaints never include headers, so I can't track
>down who has my e-mail address in an address book and has been infected.

In the case of the worm sent to Atari users, the copy of the mail I have
appears to have really have come from a famu.edu user. The headers from
the copy I received show the worm originated at 168.223.7.56 (no domain
name) and passed through mail.famu.edu (168.223.30.106) before being
delivered to my ISPs mail servers and on to me.

> I think its all down to the FPU. This gets forgotten nowadays since the
386
> and upwards have had an FPU included on the CPU die.

Small correction:

An on-chip FPU did not happen until the 80486 - chips before the 486 needed
an x87 FPU

For example: the 80386 needed an 80387 FPU to do floating point calculations
in hardware (Likewise: 8086 needed an 8087, 80286 needed an 80287) An
80486SX lacked an FPU, whereas the 80486DX had one builtin (from memory, you
could buy an 80487 [which was a full 486DX in disguise])

Floating point maths could still be done without an x87 FPU, but it needed a
large block of x86 machine code to be run by the main processor, as opposed
to a few x87 machine code instructions that could be run by the FPU in a lot
less time

Hi Tim,
Sorry m8, the ratio thing was still set from earlier in the week when i was testing stuff out. I left it on by mistake! It's off now as mine is a free server, tho i do hope some poeple are going to upload something cool every now and then if they find something worthy to download.. :-)

fwiw, the ratio thing was based on bytes uploaded not files. So, if u uploaded file(s) of around 1mb in size then u could download file(s) to the size of 40mb.. iyswim

Serial Box isn't exactly hard to find, every Mac user must already have
a copy tbh.. It ain't right, i know, but i do always offer the latest
version to all that want it. That's all. I don't force them to download
it;-)

tbh, i put this in the log on text because i got LOTS of emails almost
every day asking me if i had it. Too many lazy people not willing to
browse the folders!

I think i'll take this out though now, not had any emails for ages.. so
it works!

> appears to have really have come from a famu.edu user. The headers from
> the copy I received show the worm originated at 168.223.7.56 (no domain
> name) and passed through mail.famu.edu (168.223.30.106) before being
> delivered to my ISPs mail servers and on to me.

It's the case for the one "sent" by "Dr. Ronald D. Thomas" as we
probably have received the same mail. But I've already received the
"security patch" many times, not originated from the same servers. The
"funny" thing is that this worm often puts the emails in the Cc field,
not in the Bcc one as worms usualy do. Lots of Atari users in the list
of emails!

One common point in most of those I received:
X-Mailer: Microsoft Outlook IMO, Build 9.0.2416 (9.0.2911.0)

Needless to say that good mailers - or correctly config. ones - do not
bother with receiving such worms.

Bye,
/Pascal/

A mail client *MUST* receive the mail, or at least its headers, in order to determine whether or not it's a worm. The mail client may delete the mail automatically.

A mail server may include virus scanners to stop it from sending worms and/or delivering worms it receives to its users. That's not a client-side configuration, though, and I suspect that few mail servers are so configured. Of course, the ones that are probably handle larger domains or those that fall under heavy attack from worms.

Looking to unload the following items:

TESTED AND WORKING:
* Atari 1040STf
* Atari 520STfm
* Atari SC1224 monitor (two monitors, different styles)
* 20MB hard drive (including data cable)
* Atari mouse (1)
* Trackball (1)

UNTESTED, BUT TOLD IS STILL GOOD:
Microflyte controller, Magic SAC+ mac emulator cartridge, and two floppy drives (one internal, one external).

Also included are a couple of boxes of power connectors, data cables, and miscellaneous software, books, and manuals. Pics available upon request. E-mail me with any questions.

Not interested in parting this stuff out. Just want to find a new home for it and make room for other hobbies. Would rather not box it up and ship it out, so if you're in the Phoenix area and are interested please make offer.

They're the problem, yes. I doubt they're the cause.

>I don't really know much about the comms side/etc but
> should i try to enable more ports? :-/

Enabling all unprivileged ports should solve the problem. It
won't do anything for the cause though. Somewhat drastic methinks.

I'll risk stating the obvious because vendors like to muddle the issue,
certainly in the windoze world! Hopefully the apple arena suffers less.

Yer typical firewall tends to split the job into two tasks, inbound
connections and outbound connections. The term "open" implies the
firewall does not act on that port - things flow both ways as though the
firewall doesn't exist. A "closed" port implies the firewall will not

allow a connection but lets the thing connecting know the fact, the tcp equivilent of "bugger off, nobody at home" to use a technical phrase. :-)

In an ideal world this would suffice and is how tcp is supposed to work. Unfortunately you get no protection against DOS attacks. Thus you'll usually find a "stealth" mode - the thing connecting won't hear a peep from the firewall, like it's talking into a black hole.

A firewall ought to allow one of Open/Closed/Stealth to be applied independently to each port in each direction. Default settings tend to be most outgoing ports open (your software can initiate connections) and all inbound ports closed/stealth (even if your software is listening it'll never see it because the firewall stopped it).

Soo, errors in manual and bugs not withstanding, if you open port 21 and inbound on 3000-3150 then passive ftp job should be a good 'un!

But it's not. A working ftp server directly connected to the internet will(*) work. Ditto(*) for an ftp server connected to a firewall where the firewall is directly connected to the internet. Each item you add has to be considered as an additional node in your network. It gets complex and silly real quick.

(*)
Provided your ISP hasn't screwed something up for you. I guess you'd already be aware of this though.

An active NAT (Network Address Translation btw) layer would appear to be in effect. At what point (time to draw a diagram). Where lies the router - what's it doing (and what's its purpose, might not be the same). These are rhetorical questions. Too many possibilites to consider, even with the answers. :-(

Basic, you're sure FtpServer is 100% ok...
FtpServer <socket> ISP
...blame ISP.

Functional, you're sure FtpServer and Firewall are 100% ok...
FtpServer <port-socket-port> Firewall <port-socket-port> ISP
...already too complex to go into in depth. You have to repeat the above line for each port in the equation, in both directions, writing down its state. If the firewall can remap ports then that has to go into the equation. In fact those that have this feature may incorporate varying levels of NAT. It may or may not be marketed as NAT even if it isn't. It may or may not be that those that do implement "transparent" NAT are then unable to present a viable firewall because it's essentially a condradiction in terms. It may or may not be the case that the firewall gets bypassed under some circumstances: this leaves you in a situation where you think your firewall is facing the outside world but for some chores the machine running the firewall ends up facing the outside world. Er, we haven't even mentioned router capabilites- let's not!

> The manual says ports 3000-3150 for passive...
> I suppose i could try and forward your earlier msg to the mailing list
> for the software. Tech support is superb u c, even if over my head!

This probably all they need...

<info>
Both machines here are "FreeBSD-4.7 RELEASE". Summary: this is
reguardless of whether I dialup with NAT enabled my end or not.

Active ftp works. To date, both ends get assigned high value (30,000+)
port numbers of no particular relevence.

Passive does not work. Ftp client has to timeout sitting on SYN_SENT.
Quickie example:

$ ftp ftp://massiveftp.serveftp.com
[snip connected stuff]

$ netstat -af inet
(lose initial "tcp4 0 0" fields to avoid editor wrapping)
m41-mp1.cvx1-a.n.3222 host217-35-1-167.ftp ESTABLISHED

ftp> ls
227 Entering Passive Mode (217,35,1,167,130,76)

$ netstat -af inet
m41-mp1.cvx1-a.n.3223 host217-35-1-167.33356 SYN_SENT
m41-mp1.cvx1-a.n.3222 host217-35-1-167.ftp ESTABLISHED

ftp: connect: Operation timed out

Server 217.35.1.167 always assigns a high port number in passive mode to
which it will not respond.
</info>

My advice is not to change anything just yet. Find out how
(217,35,1,167,130,76) arrived at the ftp client. You may have the
answer lurking about in a logfile. If the 130,76 originated from your
ftp server then it is broken (130,76)=33356.

FWIW I'd be expecting it not to be broken and actually be sat listening
on a port within 3000-3150 (call it port X), and to have sent two
numbers representing X outbound. Something between your server and your
internet connection has changed those two numbers to (130,76). As
Kenneth suggested, nat(*) probably. Nat ought to translate the inbound
33356 back to X. Either nat is broken or nat couldn't translate inbound
33356 back because nat never saw it. The latter might be due to a
firewall existing closer to the internet side than nat itself is.

(*)
nat meaning not just NAT here but anything along the connection that can
cause ports to be remapped.

>Ouch. I hadn't heard of that.

Having read up on this particular virus, which NAV identifies as
W32.Gibe.B@mm, it seems that it only reads from the Windows address book
to pick where to send itself. So, it seems that this mail was sent to
Atari users, as well as former Atari users that were in the address
book. OTOH, Klez also reads local files in search of addresses to send
itself to, as well as to include as part of the payload.

Regards,
David Bolt

I got this link from MyAtari.com

http://members.tripod.com/~piters/atari/astide.htm

it claims to be an IDE driver.

does anyone have any more information on this?

information on how to program the GAL would be extremely useful.

I searched thru the entire archive of posts about this subject, and saw loads of questions asking if it was possible, and people saying sure it is in theory blah blah, but I never saw one post that said "yes, I did it and its cool".

So here is one. Yes I did it and its cool.

What is he on about you ask.

Well the ability to to share scsi devices between 2 computers on the scsi chain.

Why would you want to do that?

Well firstly its a bitch to keep unplugging drives from one machine to another (and expensive if theyre removable and you need 2 jaz/zip drives whatever) if you just want to transfer files, and serial or parallel ports are soooo slooooww, and not all of us can get our hands on ethernet for the atari line. But the real reason I wanted to do it was so that once I had recorded a track in cubase audio, I could edit the sample on the PC (I know that you can do this on the falcon, but I want more flexibility and sophisticated filters/fx etc) and load it back into cubase.

I now have my Falcon connected to a 1gb Jaz external drive (which I record onto with CAF), and also a PC is connected too (Adaptec 2940AU - changed its ID to 6). I can read and write files from both machines simultaneously on the same drive without problems (so far). I have even gone so far as to play back a composition in cubase audio, and while a particular audio track was playing I opened up the corresponding AIF file on the PC (using winamp) and played it back there too. Cubase didnt even stutter.

I know that some of you may have tried this before, so I apologise in advance for boring you (I know I am 10 years late it is 2003 after all) but maybe the next time someone wonders if they can do it, they will search and find this post and hear the words, "Yes I did and its cool".

Smeg.

Hello,

Recently my Falcon received an unexpected electrical jolt. Now when the power is turned on, it comes up with a white screen just like it would normally but nothing else ever happens. No Atari logo or RAM check ever occurs. The power supply, & HD seem OK. Any ideas at all would be appreciated.

>to occur and so the executable-floppy-in-drive-A: check occurs.

That's true, but it's important that the floppy is allways tested if there
is a harddrive or not.

Do you have any idea how stupid it is to post actual e-mail addresses
as part of a Usenet article..?

If those poor people whose e-mail addresses you posted weren't already
on spam lists before, they're now exposed, thanks to you.

While it's not likely the Atari newsgroups are a particular target of
e-mail address harvester bots, there's no assurance they WON'T be
looking for victims here when your article hits the net.

If you're not willing to munge the addresses, don't post them.

I recently built an Eiffel interface for one of my units and it works quite nicely. I am in the process of trying to add on the joystick port update. I also built the programmer.(much cheaper route) It was actually fairly simple but time consuming.

Theres a whole lot that could be wrong, but the first and probably the easiest thing to check is the RAM. (IIRC if you pull the RAM card out you get the same symptoms, so it could be fried).

If its not that then its likely to be an expensive repair... :-(

Smeg.

P.S. Ask Rodolph - he knows more than most about the Falcon. (Is he still lurking here???).

Its only 25 degrees C, today, 2 weeks ago we had 38 degrees. Over Christmas it can get up to 40-45. But Winter 17 is about average. I prefer NZ, 25 in mid summer and minus 5 in winter where I used to live.

> I've done some changes, can u plz try again? TIA

Same bad news I'm afraid...

```
ftp> ls
227 Entering Passive Mode (217,39,6,55,131,36)
ftp: connect: Operation timed out
```

```
$ netstat -af inet
Active Internet connections (including servers)
Proto Local Address Foreign Address (state)
tcp4 m4-mp1.cvx1-a.no.3961 host217-39-6-55..33572 SYN_SENT
tcp4 m4-mp1.cvx1-a.no.3960 host217-39-6-55..ftp ESTABLISHED
```

...and active still works.

Try having someone ftp in while you're on IRC/ICQ or whatever. Both of
you run your "netstat" tool and compare. Could be useful even on a
working connection. Unless someone else can chip in here, I think you'll
be forced to dig out the RFC's that describe how FTP works. A quick
search reveals it's RFC959.

1510. GEforce 4 on atari ?

Newsgroup: comp.sys.atari.st
Date: 2003-03-24 08:51:35 UTC
From: see.adresse@end.ofmessage
Message-ID: <3e7ec716$0$30758$626a54ce@news.free.fr>
Source record: 28691

Hello everybody,

I found a geforce4 PCI and even if it is a bit expensive (99 €) I'm ready to buy it and be the betatester to anyone that would try to make a driver for our computer.

As this card is recent, anybody that had a PCI slot (MSTe ?, TT with adaptor, F30 with cartridge adaptor, Milan, Had€s and CT60) could use it. So it would be a cheaper and easier way to improve our computers than waiting for an hypothetic atari designed card.

Your opinion are welcome.

Hi Galen,

>I've been pondering Laurent's Eiffel card for using PS/2 mice and
>keyboards for a while. Unfortunately, 3 emails to Laurent haven't
>received any response.

A similar gizmo is available from Peter Denk computers in Germany, one of the few remaining Atar dealers. The gizmo is an adapter with integrated microcontoller which enables to connect PS/2 mice and keyboards. It's suitable for the MegaST, MegaSTE and TT, but I suppose that with some tinkering it should work with a ST and Falcon also...
No drivers are needed.
Price for the adapter is $30,-
The adapter with a suitable mouse and German keyboard costs $43

Hello.

I bought recently an Atari 520ST with B/W Monitor.
No i'm searching a few Games (Shareware/Freeware)
who had following attributes.

-for free (shareware etc.)
-running with the B/W Monitor.
-have Place on a 720K Diskette.

Know someone such Games? TIA.

i would, but there's very few who cannot connect, erm like u! ;)
tbh Guy, i really cannot give this anymore time for the moment and (i'm
sorry to say) i'll have to accept the fact that a few people here and
there won't be able to access the site.

We're moving house in april, so as u can imagine, things are busy here.
Maybe after June'ish i'll hack at this problem more.. but for now, i'm
happy. (i get LOTS of users every day atm)

Maybe, like u were saying in an earlier email, that it is the router and
it's port forwarding that's not working 100%..?? But there has been
3xfirmware updates since i bought the thing last autumn - maybe there
will be a fix rsn? ;-)

Thanks for the replies & appreciate the pointers. Not got the time (yet)
but soon.. first things first:-)

Just following up- on my IBM clone system, using PASSIVE mode causes
the transfer to hang, regardless of which application I'm using.

Turning OFF passive mode allows WS-FTP and NetVampire to retrieve the
directories and files.

I'm not behind a firewall, and I have no idea how that would translate
to use on an Atari system, but that's how it's working for me.

I'm using SCSI drives with an ICD card. I built the system around a
MegaST board and took the DMA signals off of the internal connector.
It was a pain since I didn't have schematics for the connector, so I
had to use a continuity tester and find out which pins matched. Then
I made my own cable using a flat PC type floppy cable for one end and
modified a 25 pin connector on the other end to fit into the DMA
connector on the ICD card (I bought a 25 pin Serial plug and only
mounted the number of pins needed for the DMA plug). The other thing
I did differently was to leave all of the internal SCSI drives
un-terminated and brought the end of the SCSI cable to the back of the
case with an External SCSI connector. That way I can add additional
external devices or just put the terminator plug on the back of the
system. This allowed me to keep all of the SCSI internal in the case.
It sounds alittle confusing but it worked great. I should take some
pictures of the computer some time.

Thanks for the info. I looked at the Anodyne software awhile back and
am considering getting it. Do you know how to create a CD on an IBM
that will be readable on an Atari? I used WDFcopy to make image files
of some of the club disks on my PC and would like to be able to make a
CD on the PC that would run on both the PC and the Atari.

The other posters are right in that you need an old style montitor to use color. There are schematics on the web for making your own cable. I did it and can copy down the pinouts for you (I know I have the info somewhere). The NEC 3D is the monitor that is most often mentioned when talking about running all three video settings.

Best Electronics also makes a cable that is ready to use. They also have a long listing of monitors that will support the different video settings. Try this link

http://www.best-electronics-ca.com/monadapt.htm

Check computer swapfests and mom and pop type stores and you may be able to find a monitor for a good price

Hi Starlord,

What format is the newsletter in? If it is (mostly) text, HTML would
be the recommended method. If it is not too long, you can scan the
pages as GIFs (use about 75 DPI -- that's all the screen shows anyhow)
and place in a very simple webpage (Just make sure that you warn
people that this page is BIG!). If it is more complicated, I'd
recommend PDF format if you don't want to learn more advanced HTML.

The Classic Computer Magazine Archive (http://www.atarimagazines.com/)
does a very good job, IMHO. A newsletter would be similar, only
shorter.

As a matter of interest, do you get lots of "junk" logging in and out?
I'm on dynamic ip here so was a tad surprised to see robots probing
stuff in my ftp hierarchy when my server's enabled.

I write the newsletter using Word Perf.9.0 and it includs images and stuff, I save it two ways, word perf. and also pdf. both as a multi-page single file.

I see web sites where you click on a link to download a pdf file, just not sure who to set it up, I mostly use netscape composer for my web page writtings.
SIAR
www.starlords.org

is the site where I want to set up the DL of newsletter on.

1537. disc copy problem

Newsgroup: comp.sys.atari.st
Date: 2003-03-25 07:06:52 UTC
From: Vadim Grepan <kezal__rmv__it__@mail.ru>
Message-ID: <3E80000C.8000801@mail.ru>
Source record: 28569

Hello All!

I've tried to copy *.msa-file (704682 bytes) on floppy on my PC. I
don't have real 720Kb disks, it real rarity these days so I have to use
1.44Kb disks (of course i've sealed up the hi-density hole :)

Nevertheless i've got "Address mark not found" error when i've used
stdisk.exe or makedisk.exe utility :((Is it FDD problem or disc media
or smth else?

A normal link should do it eg...

<a href="http://www.starlords.org/directory(s) (if
required)/filename"> Link Text goes here

However intergrated systems with a PDF viewer installed (eg windoze)
might run the viewer thus displaying the page instead of just
downloading it as a file for later viewing.
I'm not sure how you would arrange things so that it only ever
downloads the file unseen if that is the only method of downloading
you wanted but the PDF viewer should have a save option if someone
want to keep a permanant copy.

If that does not work just visit the site you you know has a similar
link, click on your browsers "view Source" button and scan the source
code for the link then copy it changing the URL, directories and
filename as appropiate (creating a new blank page and then copying and
pasting their link to it and viewing that pages source code may be
easier than having to scan through someone elses entire page of code),
just hope they did not use Java script!

1541. How in the hey do I install the Hard Drive on the ST?

Newsgroup: comp.sys.atari.st
Date: 2003-03-25 08:56:00 UTC
From: kerseygraves@aol.com
Message-ID: <kerseygraves-ya02408000R2403032302040001@news-server.hawaii.rr.com>
Source record: 28573

I got a Megafile 30 at the swap meet with a cable. It powers up OK, the green and yellow lights come on, then after a while the yellow goes out and the green remains. I can heard the disk inside rotating with a steady whirr.

I have various 1040 STs and one Mega 2 ST. (Musician, you can tell :) No matter to which ST I hook up this !@#$$ hard drive, the computers just don't take notice of it. I can install a C drive icon on the Desktop, but whenever I double click the icon, I get the following error message:

"The drive you specified does not exist. Check the drive's identifier or change the drive identifier in the DISK INFORMATION dialog."

What the heck does this mean? There is no "disk information dialog" anywhere that I can see. If I select the C drive icon and go to "File / Show Info", I get this same error message again. How was this supposed to work?

You need to boot a hard disk driver off a floppy then configure the drive.
After that it should boot OK.

you can either use AHDI (the atari driver) which you can find on the net,
or much better use HDDriver which is commercial (but not expensive). There
is another driver around somewhere I cant remember what its called
(CBHD???).

You need to get yourself a copy of AHDI, the Atari Hard Disk Interface. Also get ahold of HDX. Check out the Atari archives at http://www.umich.edu/~archive/atari/

HDX allows you to format the drive and/or make it bootable.
AHDI is a driver than can be loaded at boot time in your AUTO folder or you can start it from the desktop. It should recognize your drive and make it accessible.

HDX is preferable as you won't need a floppy to boot.

There is also non-Atari drivers available such as CBHD.

Regards,
JM

Did you:

1. Cover up the HD hole on the disk.
2. Format the disk on the Atari as 720 with Fastcopy or DCformat (better
than desktops format).
3. Then put it into PC and check that you can dump PC files to it.

If you have done it this way and it doesnt work for you, it may be that the
disks you are using just wont format down (the media is a different
composition after all), or it might be that your PC's floppy drive wont cant
handle 720 disks (due to a fault?).

I have used this method before with success, but dont expect the data on the
disk to last very long. Some people have disks for 10 years like this but
others havent lasted a week.

The ST to my knowledge doesnt have a test pattern. So its likely that your RAM is bad, or your MMU has died.

Before you chuck it, try opening it up and press all the socketed chips down in thier sockets, or lift the machine horizontally 1 foot above a table/floor and drop it (yes really).

Source record: 28579

There aren't that many monochrome games about - the system was designed so that the hi-res monochrome monitor could be used for applications which needed lots of data onscreen at the same time, and the low-res colour monitor used for games.

It really is very easy to make a cable that will let you connect your Atari to almost any kind of RGB monitor, including just a TV with a SCART socket. (assuming you can get the oddball 13-pin din plug. I took mine off the mono monitor, split the cable from it in a switch box, and fitted 15-pin D plugs to the monitors and outputs from the box, because I couldn't find any extra 13-pin plugs)

Some of the later machines like the STE also had an RF modulator, so you could use a TV with nothing but an aerial socket. If you're planning to use the machine primarily for games, you really should consider using it in low-res, colour mode.

There was another piece of hardware (non atari) that used those 13pin
connectors, so you may be able to find them in an electronics suppliers
catalogue.

Only the very early 260 and 520 STF came without a built in modulator (was
seperate like the amiga's), everything after that did (thats what the 'M' in
STFM means).

You need to have a hard drive driver installed, someone here should be able to
give you the needed file for setting up the hard drive and making C: your auto
boot drive.

My ST has a RF Output (like the C64). It was just because i
haven't plenty of Room for Monitors ;) I'll see if i can
catch a cheap TV, since there a really just a few Games
for B/W Monitors.

Thanks.

You need to install a Hard Disk driver for the ST. The best one is
HDDriver. A downloadable demo of it can be found at:

I'll try to get one. But i assume the Picture Quality
would be better if i connect the TV via SCART?

I had forgotten about that viewer operation, so what I'll do is put it up as a
ZIP file for DL'ing and offline reading, they'll just need to unzip it first.

Internal Floppy drive. The 260ST used an external drive which was single
sided. (SF354 or 314 I cant 'member which), (the 260ST and the 520ST looked
more like 65/130XE's because they are not as deep as the 520STF/M/E)

Smeg.

AFAIK it's not neccesary. I've copied successfully many *.st-files (up
to 800Kb) on PC without any preformatting on my AtariST

This is actually meant in a particular order..... its not that I can't read.

>
> > 2. Format the disk on the Atari as 720 with Fastcopy or DCformat (better
> > than desktops format).
> AFAIK it's not neccesary. I've copied successfully many *.st-files (up

Sometimes it is neccesary. The PC and MSDOS doesnt format disks properly
anyway and its limited in hardware (the FDC chip) to what you can actually
do with the drive itself.
BTW the best software for formatting/reading disks is VGACopy (which is now
freeware) works under DOS and Windows (Dos shell) and looks like Fastcopy
pro. If you use this to format a 1440 disk as 720K it will show you
graphically if any sectors are weak.

Doesnt matter, some disks are constructed differently with slightly
different types of substrate coatings. Some brands work some dont.

Smeg.

Hi all,

I was given Atary 1040 ST computer. It does not have mouse. It does not have documentation... I am very good in PC (professional) but I never had Atary... That is like a new toy for me :-) Very interesting one. I want to make it work. I want to study how it works... But I faild to fined in internet and download any documentation about that computer. Can anybody help me where I can find out it?

Best regards,
Konstantin Tchebotarev

Cool :) 99.99% of people seem to be Okidoki (as u would say!), so i'm a
happy bunny!

> As a matter of interest, do you get lots of "junk" logging in and out?
> I'm on dynamic ip here so was a tad surprised to see robots probing
> stuff in my ftp hierarchy when my server's enabled.

There are quite a lot tbh (web mainly), but i'm told they are simply
'scanning' for info on what is actually there @the site..

So a google-bot if u like is searching to simply add stuff to it's
database of internet sites.. that's what i was told anyways:)

There's software on the mac to utilize this to your own advantage making
the bots go away with the info you have specifically edited. NetCloak on
the Mac does this.
You could always take a look at IPNetSentry as a back up to your routers
firewall, i have. This is one superb util imo

well go here get a mouse convertor if you cant find an atari mouse

http://www.1632-sales.zenwebhosting.com/acatalog/index.html?http%3A//www.1632-sales.zenwebhosting.com/acatalog/Mario_Becroft_Hardware_Projects.html&CatalogBody

turn on your machine (Atary :))

goto http://mysite.freeserve.com/Atarist/index.asp (my site) see what games are available

go here - download2.atarist.co.uk - ftp site with all the games from the list

write these disk images to floppy disks using an emulator or atari disk convertor, note that you will need to format these in windows 720k first (with high density hole covered) then format them on your st with fdisk three with the extra sectors needed. then copy the game onto them. (confusing to read but not really :))

stick it in your atari and play!

thank you!
Is it possible to use Atary without mouse? And I am intrresting not in
atary games, more in understending atary architecture, operating system,
other software nad stuff like that.... For example how can I get system
information? how mach memory it has? does it have hard drive or not? Is it
possible to put in Atary different operating system (linux for example)?

as far as i know, you cant run linux on your st. you can run operating systems such as magic which has been mentioned above. If your machine is just a standard 1040 ST you wont have a hard drive and you'll have 1mb of ram.

to find your way around the desktop without a mouse just hold down the alt button and use the cursors and insert for left click.

Rodolphe seems found the SDRAM burst problem (in R/W) since the signals
are displayed with his analyser.
Like you, I hope found "the end of the tunnel".

Try with an inch if you like. Size doesnt matter. Or does it? ;)

I didn't think all this was necessary. My old 1040ST could read 720kb PC formatted disks just fine. It was going the other direction that I ever had difficulty. Then I had to use a special formatting program to go from an Atari-formatted disk to PC. So why not simply format a 720kb disk on the PC, save the stuff you want to port over, put in in the ST drive and watch it go? That always worked for me, anyway. Maybe I'm remembering it wrong since it's been a while since I gave my ST to a friend after I got my Falcon.

The original user manuals weren't that great, so you are not missing much.
You should check out the Atari (with an I) ST QuickFAQ. It's a very good
starting point.

http://www.megacom.net/~q-funk/ST/

You can use a PC serial mouse with the appropriate driver. It will only
work correctly in GEM mode, that is in programs using the windowing
system, such as text editors. You can probably find the driver on the
best FTP site for the Atari range of computers:

ftp://chapelie.rma.ac.be

The driver is called "mouse" or something.

I hope you'll have fun with your machine.

>like QuickIndex?

The best are probably SYSINFO by Andreas Schley and PROFILE by
Mark Baines. Both give you more information than you are likely to
want! PROFILE has some problems with submenus on a Falcon, but if
you use File/Report, all of the tests will be written to a file of
your choosing. SYSINFO's HYP is in German, though the program
itself is in English.

Both should be available from most Atari sites, such as the
Belgian one at
ftp://chapelie.rma.ac.be/atari/
and SYSINFO from DDP Translations at
http://www.cix.co.uk/~derryck/index.htm

I downloaded from Umich AHDI and HDX in some la la format called .zoo ... I did download z0021.ttp which is the expander program according to the listing, but the program does not make the slightest sense.

So to make the HD work at all, I need to install some driver, which requires some weird-ass expander, which will require some yet other thing to work and so on... nah, it's time for a screeching U-turn, right here and now.

Ladies and gentlemen, if someone lives near me in Hawaii you can pick up these 3 Atari STs with the Hybrid Arts ADAP, Avalon, Notator, Softsynth, Turbosynth, Unitor, dongles, manuals, the whole shiznit, or the whole 2 cartfuls of stuff goes straight to the dumpster this weekend. Case closed, I'm gone to buy a dedicated hardware MIDI sequencer.

>Is it possible to use Atary without mouse?

Hello,

You can use the combination of Alt-Arrow keys to move the cursor. For smaller movements use Shift-Alt-Arrow keys. For mouse clicks Alt-Insert is for left button, and Alt-Clr Home is for the right. This is not a great way to get around, but it will suffice until you get a mouse.

Good luck,

This is a long way from Shrewsbury. Even so, when you get there, they will insist on seeing some corporate ID like a cheque book or letter-head. They will not serve you otherwise.

(I know. I argued with them for 2 hours until they let me take the stuff, and I have an account with them).

When you start z0021.ttp a box appears, just enter:
-e file_to_be_uncompressed

If memory serves me right. It's easier if all the files are in the
same path. Been a while since I used un-zoo, if -e don't work try -d
or -x. I'm sure it's one of those but since there are several forms of
comression, they all use different command line switches.

I have had a couple of more mischevious visitors using different
flavours of the same tool. Primary purpose appears to be seeing if they
can use me as a warez dumping ground, although there is an attempt to
write 'bin' but that might just be part of the tool trying all the
directories it can list.

My ftp server isn't "public". I just enable it before visiting
somewhere I can't use ssh from. Saves trailing wads of floppies around.
Trouble is I often forget to disable it again so I did actually get
bitten some warez tests on 'incoming'. Feel free to laugh...

Feb 20 16:11:14 sd ftpd[6914]: connection from
66-143-188-98.ded.swbell.net (66.143.188.98)
Feb 20 16:11:15 sd ftpd[6914]: ANONYMOUS FTP LOGIN FROM
66-143-188-98.ded.swbell.net, ano@ano.com
Feb 20 16:11:22 sd ftpd[6914]: put bin/384.679
Feb 20 16:11:27 sd ftpd[6914]: put etc/384.679
Feb 20 16:12:11 sd ftpd[6914]: put incoming/384.679 = 104154 bytes
Feb 20 16:12:25 sd ftpd[6914]: get incoming/384.679 = 104154 bytes
Feb 20 16:12:30 sd ftpd[6914]: delete incoming/384.679

...duh! Guess who forgot to do "rmdir incoming" in the first place! ;-)

Hi Didier,

Thanks for trouble shooting information. Sometimes design software and
data sheets can not show the "little" problems. The analyser is the
best tool for a Falcon "tune up".

Is the hardware configuration for the CT 060 still as shown on the CT
060 website? From reading Rodolphe's usenet post, the cards have been
manufactured in numbers now.

Some other usenet people suggest there is time to alter major card
design. Don't know whom, or what relationship this person might of had
with Rodolphe.

I don't think that a "usenet vote" is anyway to express design
concerns for a product already manufactured:)

Is Rodolphe involved with this "SuperVidel", or is he only a supporter
of it's idea for use with his product?

Thanks,
Mike

There exists (on the Falcon only ?) a 256-colour image format where there are 8 bit planes that are interleaved in blocks of 16 pixels. Are there any images in this format online ? Ideally with the same image in .png or other portable format, so that I can verify that it's been decoded correctly.

Thanks !

Isnt this how the 8Bit BMP format is stored?

If not it should be fairly simple to write some 68000 code to convert one
into 8 plane interleaved mode.

Strangely enough I had a mischevious idea of my own: monitor incoming.
The moment something completes, move it elsewhere that isn't readable
then immediately create a file of the same name and size but full of
zeroes. Let'em have that back. Ahem! <G>

Rodolphe is not involved in the actual development of the
"SuperVidel", but we have been in contact with him when we started the
SuperVidel project. He thinks it's a good project, just like we do. :)

Steem 2.4 really works GREAT! It is the first time for me to test it out on my Dell 4550 Dimension, 2.4 Ghz, WinXP today. It brings back my college days memories!! :o)

Problem about RickDangerous: it gave me 2 bombs (running TOS 2.06) after seeing a pirate-skeleton on screen. But using TOS 1.4, I passed this pirate-skeleton guy and got a music on-screen. Pressing F1-F10 changes musics, but how do I play Rick Dangerous? Is there a secret key codes to start the game?

I noticed that after I download the Medway Boys's version of RickDangerous - that one works ok, without music demo - I think both TOS 1.4 and 2.06)

I think I have tried TOS 1.4 and 2.06 with Rick Dangerous, either works OK, playable. Thanks to the STeem author! :o)

Mike

1604. Converting regular ST .zip file to ST disk image?

Newsgroup: comp.sys.atari.st
Date: 2003-03-28 09:07:33 UTC
From: mstepansky@aol.com
Message-ID: <20030328040733.28056.00000024@mb-ci.aol.com>
Source record: 28486

I have downloaded Medway's Boys "RickDangerous" disk image version (CD28.zip). Works ok with STeem.

But when I downloaded other ST games, such as "bubbleghost" and "crystalcastle" from other FTP site (217.215.10.41), STeem couldn't use them. I suspect those 2 games are just plain ST files (compressed as .zip) - rather than an ST disk image format.

HOW do I convert those ST .zip files into a working ST disk image format for me to play in STeem (or any other ST emulators)? STeem can do ST, MSA and (what else?)disk image format, right?

Thanks for the help. It is a starting point.

Mike

If your gonna run mostly games in steem then use TOS 1.0 for ST games and
1.62 for STE games. This will give you the least amount of trouble.

Sorry, shitty OE doesn't allow me to change the send to email address. cant send you an Email!

I'm in Perth, have a mint condition 4Mb 1040STE. only one problem and that's is the floppy drive main motor occasional stalls. Ask anyone here, its a common problem. she just needs a new drive.

I also have a working Megafile 30 if your interested.

Make an offer!

that;s exactly wot i was going to say! Even on my humble 350mhz Mac,
TOS1.0 always produces the best results

1610. SCSI en HDDriver

Newsgroup: comp.sys.atari.st
Date: 2003-03-28 14:50:15 UTC
From: "J.J.van de Gruiter" <jos_van_de_gruiter@hotmail.com>
Message-ID: <b61nesata1@news1.tilbu1.nb.home.nl>
Source record: 28492

Hello Atarians,

I want to put a new SCSI disc in my Mega STe to replace the old 48 MB one.
I've read (Atari FAQ) that there was a 1 Gb limit. Is it possible to use 4,5
Gb (it's difficult to get them smaller these days),

I know 3,5 Gb will be wasted, but I was wondering if HDDriver would
recognize/ see this wasted memory.

Also, what is the maximum partition Diamond Edge can manage?

Thanx,

Jos
http://www.9daysonder.nl (see: gear)

I have a 540MB SCSI in mine, but there are 3 partitions on it (It was like
it when I got it, and I cant be bothered/dont need to experiment with
changing it).
A 4gb drive wont be wasted. At the very worst I think you will have to have
loads of 256mb partitions (8?). I cant remember exactly what TOS 2.06
allows. HDDriver is the best way to go though whichever you decide.

Diamond edge probably works thru TOS so its down to TOS what maximum
partition it will see. (I also use it on my Falcon 1.2GB Ide and 1Gb JAZ).

Smeg.

I played around with this and found the internal Scsi interface could only
handle 1gig and one drive it was also very fussy, best bet would be put
something like the link inside as there is plenty of room you could then use
a big drive and connect more items if needed

1614. TechTV want's Atari users

Newsgroup: comp.sys.atari.st
Date: 2003-03-28 20:21:59 UTC
From: LS <me@email.com>
Message-ID: <a2195e35d4903d276c39fe139aa506b9@news.teranews.com>
Source record: 28496

I found this on http://www.atariforums.com

I don't know if TechTV is available anywhere else but North America, but even if it's not, Atari users here should be interested in this post.

For those of you who aren't familiar with TechTV, it's a cable television network all about technology, computers, etc. There are many invidual shows on the channel, the most popular being a show called "The Screen Savers". It's basically a computer show, where they feature information on new stuff, tech help, tips, web site features, etc.

In their most recent show, they mentioned at the end that they noticed that about 5% of the people who visit the TechTV/Screen Savers web site are using Atari computers, and they want to know how!
:-)

And here's what they posted recently on their site:

"Got Atari?
We've received statistics that a few brave souls out there visit this very site using Atari computers (STs, we're guessing.) If you're one of those souls, email Joshua Brentano. We'd like to feature you on the site and/or show."

(by the way, this guy's e-mail address is: joshua@techtv.com)

So, I'm planning to e-mail them myself, since I still use my Falcon daily (although not much for web surfing these days). But I think we really need some more of you who are actively using your STs or Falcons on the Internet (and Hades users too I suppose). This show would be a great way to get the word out about Atari users, and how we're still going strong. I'm sure they would be quite surprised to see what we're still capable of doing with Atari computers.

So, send an e-mail to the address above, or visit the TechTV / Screen Savers web site if you want to find out more about them. And by the way, here is the specific link where they posted the request for Atari users to contact them (about half way down the page):

http://www.techtv.com/screensavers/shownotes/story/0,24330,3401453,00.html

And for what it's worth, I have no connection to TechTV, or "The Screen Savers". It's just that I think it would be really cool to see some Atari hardware and software featured on their show. Heck, in the past, they have done segments on Atari video games, and emulation, and the main host (Leo Laporte) has mentioned many times that he has fond memories of Atari computers, as his first computer was an Atari 8-bit.

So, let's all send them an e-mail. Who knows, maybe we'll even be asked to be on the show?

Either that is new news, or rehashed old news. I mailed them before after seeing such a blurb on the site, some time ago. No responce back, others mailed them as well.

Its the TOS that only can handle 1GB, - its got nothing to do with the Host Adapter. And yes you can have more than one drive on it, but you have to do a modification in order to do so. See http://chimo.unimo.it/~vezz/atari/hardware/drives.html and look for SCSIMSTE.ZIP (E) Fit two SCSI hard disk in your Mega STE or Stacy.

I've doing some major shifting around of things in my trailer and I'll be moving my TT over to a long table where it will have a 1040ST sitting next to it. I want to get my TT fully up and running, I've not been able to afford the $100 for a new keyboard and I lost the e-mail address of a guy in Palmdale with a mega KB, but I would rather meet 1/2 way (in lancaster) than mail this broken one. Question, does Best Elec. have a web site? What I need is the black plastic part that holds the keys and has the little hooks on the back, do they have that part? The TT's been down for 4 years now and I want it back up, then maybe I could get it online again.

remove the <*> for my e-mail.

Mike,

There are programs that will convert ST disks to MSA files and
vice versa. If you do not have one of these programs, email me and
I will send one to you...

Message-ID: <20030329041805.28126.00000076@mb-cj.aol.com>
Source record: 28505

Thanks for the tip in using TOS 1.0 to run ST games (or 1.62 to run STE games) to get the least trouble playing 'em.

How can I tell which games was original for ST and which games was originally for STe computer? SO that way I can tell which TOS version # to use.

Is there a complete listing (with side by side column comparison) of ST and STE games?

Mike

1624. Trying to run BUBBLEGHOST in STEem

Newsgroup: comp.sys.atari.st
Date: 2003-03-29 09:33:33 UTC
From: mstepansky@aol.com
Message-ID: <20030329043333.28126.00000077@mb-cj.aol.com>
Source record: 28506

I downloaded "BUBLEGOS.zip" from FTP site 217.215.10.41, under letter "B".

When I unzip it, this is what I got:

"BUBLEGOS" folder - in it are the following files:

<GHOSTBUB.BLE> this folder contains: Ghost.dat, Ghost (1kb), Ghost.LOA, Ghost.VOI, Ghost (screensaver or self-runnning splash screen for ST?), Ghost (55kb), Ghost.PRE.

Result.TRA
Title.TRA
FILE_ID.DIZ file (in this file, it says "How do I play it?" by somebody else)

Bubble Ghost is a game that I remember for ST - when you boot up, it will say "BubbleGhost!" or "Welcome to BubbleGhost" digitized voice...and you as a cute ghost have to blow a bubble throughout the adventures....blowing out the candle is another, all kinds of activity. Cool games....

Now where is a working BubbleGhost for?

Mike

Source record: 28507

Let me put this way:

If I have an ST game disk (whatever format, tracks I use back in the early days), is it possible to convert them into a diskimage format (.st or .msa) for STeem?

(does that mean I have to insert ST floppy in the PC drive or in the ST drive for conversion process??)

How about the opposite direction - from .ST or .MSA disk image into a regular ST disk floppy that I can insert in ST drive on a real ST computer?

Is there any emulator that can read and execute ST binary, games? (unlike the disk image that emulators use- just curious)

Mike

1626. Which ST emulator is the most popular, almost real "ST"?

Newsgroup: comp.sys.atari.st
Date: 2003-03-29 09:48:30 UTC

Source record: 28508

Now that I have play with STeem emu on a PC, I am wondering which emulator is the most stable, virtually "complete" (or almost there) ST on a PC?

I have yet to try STew, Nostaglia, Pacifist, GEMulator, Aranym (sp?), SainT, TOSBOX, Stonx, PowerST, Chimeric (?), Winston (now known as Stew, I think), Echo, Fast....and non-TOS emulator called Hatari.

When people say "2600 emulator for PC", people would think "Stella" come to mind. Which ST emulator is popular for WinXP and one for DOS (or whatever)?

Finally, how do I connect the classic Atari CX40 joystick in a PC? I have no clue as how to I find adapter for that one? Is there a walkthrough steps on the web? Or doe anyone care to sell a modified CX40 joystick? (does it use serial or parallel or USB?)

mike

Hi there, I'm just letting you all know that I have the above
mentiooned hardware available for sale. (I could sell them worldwide,
though payment may be a problem)

They came with all neccesary cabling to connect it to the falcon, the
only thing you'll have to find is a 12volt adapter.

Let me know if you're interested, or indeed make me an offer.

Thanks.. Rob (UK)

Hi,

I find that Steem is the best one if I want to play games of any kind. Use TOS 1.62 for STe games. I must admit I haven't actually got any games that don't work on it.

If you want something a bit more advanced for applications, I find you can't beat Aranym but network support doesn't yet exist for the Windows platform.

I havent downloaded any new emulators recently, but I use Steem 2.1 which is great if you run windows, but my all time fave has to be Pacifist which runs under DOS, (and windows dos box) but is so easy to use. Pacifist hasnt been updated for a while so theres a few games that dont run on it, or have grafix problems, but it is very fast, you can use it on low end PC's.

You can use any old digital joystick in a PC analogue joystick port if you make an adapter. You wont see adapters for serial or parallel, and Im guessing neither USB, however there is a way you can do it. There is a product called I-Pac which people use to connect control panels of an arcade machine to a PC that sits inside. You can take the connector off the joystick and put the wires directly into the Ipac because it has little screw terminals so you dont even have to solder. It has 28 inputs so you could connect 5 joysticks with 1 fire button each (5 * 5 = 25 inputs) or 4 joysticks with 2 fire buttons (4 * 6 = 24 inputs) if you wanted to and you would still have inputs left over. Then you connect it to your PC via the keyboard OR the USB socket. (I bought the Jpac for my arcade machine which has a different connector on it, but I can tell you that these work great).

>or smth else?
>

Hi All

Yep i'm still alive, not quite kicking but alive:PPP

The age old problem of sharing disks between pc and st!

High Density (HD) have a slightly different type of media than double
density disks. Obviously cramming in twice the data in the same area
things would need to change slightly.

As a rule HD disks are slightly thinner and HD drives usually use a
smaller magnetic field to write to the disks.

Although you can punch an extra hole in DD disks and use them as HD,
it's NOT always possible to do the other way around.

I have one ST that wont even bother reading them, let alone getting a
directory. And all it takes is 1-bit in the data stream to be corrupt
and file/program is useless.

I also have a nice external drive that doesnt mind what disk you stick
in, even the bad disks can be read 50% of the time.

If you format your disk DD, or HD if you have a HD drive fitted, on your
Atari you can take advantage of extended formatting AND this CAN be read
by your PC, you do need a program to stick the ms-dos stuff on it. I use
Double Clicks DCformat3. You can download it from:

www.steverosie.demon.co.uk/dcf3.zip

You could try formatting a HD disk on the PC as a 720k disks and hope
that the st drive can read it. I usually do ALL my HD disk on the pc and
transfer the data onto that disk, I've had no problems at all on TOS
1.06, 1.62, 2.05 and 2.06.

There probably is, but ive never found one. The way I do it is run everything under 1.62. Then if I get a game that crashes or displays strange colours then I switch to 1.0 and reboot. Since my first real ST was actually a Tos 1.60 STE (with the infamous desktop.inf bug) I have run hundreds of games on the real thing and only ever had a few problems, like a couple of Automation menus, and a few of the older games, but the games thing was usually a disk protection check failure cos of the change in the STE's hardware or TOS.

I really wish I hadnt given my STE away now :,-)

SR>the drive, none wasted.
It's the STE that makes the problem, the TT will work fine ever.

Youre right it doesnt. But you should be able to put a SCSI Cdrom on it, and that would suffice for most peoples needs. Personally I'd rather build an internal IDE interface, and sell the SCSI board to someone who needs it, though Im happy with what ive got cos 500mb on an Atari is huge anyway, and I only use it for games (I have a Falcon for music work).

> as for STacy where the hell are you going to put a second HD inside?

Haha. Probably hanging by a cable on the outside of the case or even better velcro it to the lid :-)

While it doesn't have an ICD host, I used ICD formatting to do the 2 gi drive I
have in my TT and it works fine, it used the ICD big file sector. Not sure if
TOS 3.6 has that limit in it.

The Magic Shadow Archive disk format is a compressed file. Im sure if you do
a search on the net (I cant remember who wrote it, was it Jaysoft?) you will
find comprehensive info.

Firstly there is a program called ymplay on the ST that can playback these chip musics, and there are players and plugins for Winamp and internet explorer on the PC, amongst other things.

There is an archive around that has a virtually complete archive of .ym tunes from all the games and menus etc. I had it on my PC, but I cant remember where I downloaded it from.

Do a search on the net, and im sure youll find it.

Search on the GEMDEMO site (an Sverige site ?) and you'll find 4 Mo of mics
of that kind. Sorry I lost the url.

A description of the MSA format can be found in the source code of the
Hatari emulator, http://hatari.sourceforge.net/, file msa.c.

cheers,
Matthias

Yeah I do have a lot of YM tune, over 6,000 of the thing! finding the one
I'm after seems like a impossible mission. It would have been on a PD disc
as a stand alsone program or on a coverdisc. I've already checked all my
Fav's and most of my disc collection with no luck. It is a TOS program so
there can't be that many of them about, if I can find them.....

1648. STing and my EtherNet card

Newsgroup: comp.sys.atari.st
Date: 2003-03-30 15:13:20 UTC
From: "Edward S. Baiz Jr." <edbaizjr@attbi.com>
Message-ID: <3e86b4123c71f0@attbi.com>
Source record: 28529

Hello all,

I was wondering if anyone has gotten STing to work through an EtherNet card and a router. Does STing have to have the driver for the card (with STX extension) have to exist before this will happen or is there some other way. I would like to get it working so I can use BNET to talk to my STe so as to be able to back it up using my Hades.

this thread now has me confused, I had always thought it was a 1Gig limit
because of the Atari host, my testing was on both a Stacy and Mega ste
running their own Tos, if this is the case and you have it maybe using
MagicC would help, I have used this but only on a Falcon that will handle
big drives anyway

Jakie,
TOS no matter what version should be able to handle
at least 1 GB paritions. So if you have a 4.5 GB hard
drive you will need 5 partitions to get full access of
all available space. HDDriver should be able to do
this for you. Now if you use Magic you can use FAT32
partition sceem which you would only have to have 1
partition at 4.5 GB. The original LINK 1 can go up to
1 GB in size per partition. The LINK 2 can go higher
than 1 GB with the right Hard Disk Driver such as
HDDriver.

Thanks,
Carey Christenson

Bonjour :)

>I was wondering if anyone has gotten STing to work through an
>EtherNet card and a router. Does STing have to have the driver for
>the card (with STX extension) have to exist before this will
>happen or is there some other way. I would like to get it working
>so I can use BNET to talk to my STe so as to be able to back it up
>using my Hades.

My LAN is Atari only : Falcon and MegaST4. Both have EtherNEC cards
and all is linked to a DSL router-modem called Netgear DG814. This
router has also a switch (4 RJ45 ports). Works pretty well, but:
- when I boot/switch on/use for the first time this router:
~10 seconds for the router to recognize the Atari machine (no DHCP).
- sometimes, the DSL connection won't start (> 10 s), I have to
reapply the connection parameters in the small website/firmware of
the machine.

The ROUTER.TAB must be configured to routes the IP addresses to
the WAN like this:

192.168.0.0 255.255.255.240 EtherNet 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

Falcon has 192.168.0.2
MegaST has 192.168.0.3
DG814 has 192.168.0.1

I use the official and none-modified ENEC and ENEC3.

Bye

Pierre

Yes, the .STX file is in fact a driver for the particular card. If you
have a .STX that fits your Ethernet solution _and_ computer you will be
OK.

Others have to tell what solutions there are for a Hades.

>~10 seconds for the router to recognize the Atari machine (no DHCP).

The same happens here with a Netgear RT314. I suppose this is because the
built in switch has to determine where the packets should go before there
is an ARP table.

>The ROUTER.TAB must be configured to routes the IP addresses to
>the WAN like this:
>
>192.168.0.0 255.255.255.240 EtherNet 0.0.0.0

Is there any particular reason why you use the above line?

>0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

This line should be all that is needed.

>Falcon has 192.168.0.2
>MegaST has 192.168.0.3
>DG814 has 192.168.0.1
>
>I use the official and none-modified ENEC and ENEC3.

Me too, but with a TT.

Edward,
Not sure which way round the question. If you are using the Cartridge or ASCI adaptors, with ISA cards as per http://hardware.atari.org/ then there are STing drivers included. I use my STE via my Router and it all works fine.
If you ahve DHCP on then you may need to reserve an address for the STE as the STing driver needs static IP.

I put some info at http://www.dwade.freeserve.co.uk/atari/main.html

Source record: 28539

Hello,

I am having some difficulty logging into a site with Telnet.

First, I Connect with IConnect.
Docs, say double click on Telnet.TTP
I do but get a PARAMATER dialog box.
(I type in host address - program locks)

I reboot, reconnect with IConnect.
start CAB.
Open local...Telnet.TTP
I get COMMAND LINE dialog box.
Type in host, then it connects.
But seems so slow that it doesn't even allow me to login.

Why can't I get a COMMAND LINE dialog box, without entering CAB?

Thank you in advance

ken

With the MegaSTE's SCSI host adapter you can only access the first GByte
of an SCSI drive. This is a hardware issue and you need an
ICD-compatible host adapter, e.g. a LINK96/97, to be able to use the
full capacity of SCSI drives > 1 GByte.

> Its the TOS that only can handle 1GB, - its got nothing to do with the Host
> Adapter. And yes you can have more than one drive on it, but you have to do

The maximum partition size depends on the version of TOS. TOS 2.0x and
3.0x can *not* handle partitions of 1 GB. But even with old versions of
TOS you can have 14 partitions with at least 256 GByte each, which is
much more than 1 GByte.
Won't help you much with the MegaSTE as the internal host adapter can
not access more than the first GByte of a SCSI drive.

You cannot compare the TT with the MegaSTE. The TT has a real SCSI bus,
the MegaSTE has not but only has Atari's proprietary ACSI bus.

> big drives anyway

Don't let others confuse you. What you say is correct. The 1 GByte capacity limit for SCSI drives connected to the MegaSTE is a limit imposed by the MegaSTE's hardware. With ICD compatible host adapters you can make use of larger drives, without such an adapter you can only access the first GB of a SCSI drive. Note that these limitations do not apply to the TT and Falcon as they have a full-featured SCSI bus.
There are also limits wrt the partition sizes, depending on the TOS version. These limits, however, are independent from the hardware. TOS 1.0x can handle partitions up to 256 MB, TOS 2.0x/3.0x up to 512 MB, TOS 4.0x up to 1 GB. Larger partitions require MagiC or MiNT, which support FAT32 or Linux ext2 filesystems.

Two ST 1040's with heaps of software are going. The last remaining Mega ST gets an "after last chance" with an AHDI floppy I am trading for, then if this doesn't get it working, it's gonna go too.

I have received so far 3 local replies, and 50 worldwide ones from as far as Belgium... the latter 50 I have to answer yet, when I get enough spare time.

Plug it into the ST's modem port and power it up.

Get a terminal or BBS comms software (theres loads)

make sure you have 8,n,1 set and go to the main screen and type AT and press
<RETURN>

If you see an "OK" then youre modem works if not type AT&F <RETURN> to reset
the paramaters and try AT again.

Once you know your modem works you can concentrate on getting it on the net.

Someone else take it from here, cos I dont know Sting/Stik etc.

You must use an IConnect-compatible Telnet client with an IConnect
connection, unless you have also loaded the STiNG/STiK gateway IFusion
(included with the ftp client Fiffi from ASH).

Teli is the IConnect Telnet client.

>I reboot, reconnect with IConnect.
>start CAB.
>Open local...Telnet.TTP

The Open local menu item is only for loading HTML files!

Cheers

There's no reason why it shouldn't work if as you say it's a stand-alone
modem and has the usual D-way connector on the back.

Only one way to find out for sure!

Cheers

1671. [UPD] April Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-03-31 10:53:14 UTC
From: François LE COAT <lecoat@lutece.net>
Message-ID: <3E881E1A.8010104@lutece.net>
Source record: 28601

Hi,

My software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka304.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

Besides Eureka's usual improvements, the documentation
is updated, and a detailed list of functions, options
and constants is available.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12

> Is there any particular reason why you use the above line?

This line is for the local network, for the Ataris to communicate togheter,
mostly with BNet under MagiC.
The IP between 192.168.0.1 to 192.168.0.15 are LAN only.

Bye

Pierre

For Midi:
STEEM provides access to Midi devices in the PC version. But I'm not a musician so I cannot tell in detail if it really works as expected or if popular ST midi apps do work correctly.

For Soundchip sound:
Emulation for the soundchip exists almost everywhere in emulators but its accuracy is not 100% although STEEM and SainT seem to match the original in most cases.

1678. Laserjet 1200 with Atari?

Newsgroup: comp.sys.atari.st
Date: 2003-03-31 19:30:07 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3e88a54467e3a0@tripnet.se>
Source record: 28608

Is anyone using the Laserjet 1200 printer with Atari hardware?

I tried today with my Stacy and it did not work at all. With a basic setup the printer did not react at all and the computer acted as if everything got printed.

With Iprn parallel accelerator activated the computer did a total freeze and only the reset switch responded.

I tried a program written by myself that talks PCL5, A NVDI4 Laserjet 5 driver and standard ASCII printout with Everst. None worked.

I then tried a Laserjet 6 printer and all was fine, strange! cables are OK.

The Laserjet 1200 claims to be both PCL 5e and PCL 6 compatible. PCL 6 is a new standard that can't be used with Atari's afaik. But PCL 5e should be backwards compatible and therefore work just as well as with a Laserjet 6 printer.

As the Iprn autofolder program crasched I suspect the printer is sending something back to the computer using bidirectional parallel comms?

Can Magic handle FAT32 partitions? If so which version?

I've tried creating FAT32 partitions with both HD Driver and the MINT
utility. They appeared to be fine as far as HD Driver is concerned but
Magic 6.01 steadfastly refused to recognize them.

I've just acquired and installed the English version of 6.20 - should
I try again?

The Magic manual in English for v6 talks about VFAT but makes no
mention of FAT32. There's nothing about FAT32 in the notes that came
with 6.20 .

I've asked Atari Workshop. They couldn't help. I've asked before on
this list.

If Magic can handle FAT32 there must be some setting that I'm not
turning on or some bit of software that I've failed to install.

A lot of modern printers do require bidirectional parallel cables with x86
hardware. I don't know how this would interact with an Atari ST, though.
It might be worth trying an IEEE-1284 cable; at worst you'll be out a few
bucks for the new cable.

Before buying a new cable, though, you might try a PostScript driver. The
HP LaserJet 1200 is supposed to understand not just PCL 5e and PCL 6 but
also PostScript Level 2.

Hi!

You can use plip protocol (MiNT-Net) to network two Atari computers via
parallel port.

I think there is no port of this protocol for Windows or even Linux. You
cannot use PC parallel protocols due to reduced set of control signals on
Atari printer ports.

Regards,

Alexander

That would not be possible, the Atari uses a uni-directional printer port.

Jakie,
I suggest that you do the same. When I purchased a
1040STf from an auction. HDDriver 7.63 came with this
setup along with many other pieces of software. I am
running TOS 1.62 and have had 512 meg partitions on
this computer. HEll I have even had 1 GB partitions.
I know what the heck I am talking about since I have
been in the Atari world for over 15 years. Matter of
fact I have asked about these same limits we talk
about to UWE himself. If you would have read further
in my post it said that he may need to get a LINK 1 or
preferably a LINK 2 or 96/97 as they are sometimes
referred to as. Besides that, one should invest the
money into a LINK host adapter as they are far
superior to the Atari's own host adapter inside the
computer.

P.S. Besides I have done things with my Falcon 030
that would make your head spin JACK.

Thanks,
Carey Christenson

You might be able to do that using PLIP with a Linux system, but there
doesn't appear to be a Windows compatible PLIP driver. On the other
hand, if you want to use a serial connection, the site here:

<URL:http://www.serial-networking.fsnet.co.uk/index2.htm>

give the information for linking an Acorn to a Win9x machine.
Fortunately, these instructions should be fairly easy to adapt.

There's also:

<URL:http://www.atari-source.com/~bredroll/magic/network.htm>

which details connecting a Falcon to a Linux system.

Fortunately, that is incorrect[0]. The parallel ports on the Atari are
bi-directional. It's just that most control lines are not present which
means an Atari can't use things like parallel-port zip drives.

[0] If it were correct, printer port sound samplers[1] wouldn't have
worked.

[1] The original Replay used one of these before swapping to a cartridge
port sampler. I've still got one somewhere, although mine came with
ProSound Designer.

Hey all,

Been awhile since the last newsgroup update (so much I can't even remember.) But TAT is still plugging along. New articles are posted to the site every couple of days. I'd list them, but it'd be too many, I'm afraid!

There's some interesting stuff on there now, especially if you're a Lynx fan. New reviews and articles for the handheld. (As well as a very special surprise!)

Check us out over at http://www.ataritimes.com !

TOS 1.62 definitely does not support partitions of 1 GB.

> I know what the heck I am talking about since I have
> been in the Atari world for over 15 years. Matter of

I'm sorry, but you are wrong. You cannot use FAT partitions of 1 GB with
TOS 1.62. This only works with TOS 4.0 or MiNT or MagiC.

Using a recent version of HDDRIVER to create a FAT32 partition (enter
F32 as partition type) should be sufficient.

That is not true. Atari has bi-directional printer ports.

Unfortunetly there isn't a solution yet for accesing Internet using parrel
link, but I know at least one man that is working on it.

No...

I just want to use Atari classic CX40 joystick and nothing else.

Now, does anyone have (or sell) existing adapter for the CX40 joystick? I want to plug it in and ready to play with ST games running under STeem on a PC.

I dont want to make one because I know nothing about electronics and dont know who to find one to build one for me.

I am hoping to find a universal adaptor which will allow me to use this CX40 joystick to work on a PC running Stella (2600 emulator), Atari800Win 3.1 (800xl) emulator and also STeem.

There gotta be a way to find one who knows how to make one for me (and for other ST users) and I will PAY for it.

I am satisifed with your answers about STeem emu for PC. Good enuff - I am beginning to enjoy the STeem now and then. Thank you!

Still I need a CX40 joystick to go with it. My 520ST back in 1989 did work with this joystick.

Mike

Hey!

I know to admit when im wrong, and the only person I would trust to give
this sort of info would be Uwe. But YOU.... how dare you tell me to be
ashamed for trying to help someone out. You go f*k yourself.

I have installed steem emulator on my PC now i'm trying to look at
CubaseLite that I downloaded off Tims Atari Midi World but i have no
experience on atari's and little on pc's. can anyone help.
i got as far as the question...
Select Screen Driver? VDI Quick

The universal adaptor for CX40 was developed by the Atari800 project. Now
you just need STella and STeem to follow it.

> STEEM for games and MIDI. Gemulator for program development...

For program development we launched the ARAnyM project (http://aranym.sf.net/) - we think it is better suited for that task thanks to its almost unlimited RAM, perfect graphics capabilities, direct disk access/hostfs access, networking capability and also the JIT compiler for CPU (ARAnyM is thus extremely fast - you can use even GCC for compiling C source code - something that almost nobody does on old Atari computers :-).

Although on the surface DDP Translations might have seemed to have been sleeping after a hard winter, nothing could be further from the truth.

Just added to the web site are English translations for Dick Meuldijk's extensive and very useful Scripter scripts for jinnee's context-sensitive popup menu system, and resource and bubblegem help files for Armin Diedering's special Christmas release of ResourceMaster 3.50.

Waiting in the wings (I'm currently proof-reading the hypertext) is practically a 100% complete set of English files for the Texel 2.20 spreadsheet. There will even be a patch file for all that bubblegem help text that is embedded in the binary, all you have to do is to translate the example spreadsheets yourself :-) Expect an announcement some time next month.

Cheers

Derryck

I can't believe how worthy I felt afterwards, that is until I looked
at the web page at work and found that all html pages except the home
page had mysteriously lost their contents!

I'll try and repair the problem tomorrow (Wednesday), and as a special
treat I shall also upload an English configuration program for
MagiCMac 6.20. Can't say fairer than that, now can I?

Cheers

Source record: 28644

Ok, I was wrong about the 1 GB on TOS 1.62 but I have
used 512 meg FAT partitions on my 1040STf with TOS
1.62. It says right in the HELP tab inside HDDRIVER
7.61 the following:

1.00-1.02 256 megs
1.04-3.0x 512 megs
4.0x magic and mint 1 GB, 2 GB if DOS compatible

Also with MAGIC and MINT you can use FAT32 which is
only limited by the size of the drive. This I know
has been stated by Uwe and others many times. I would
think that anyone that does not have a LINK 1 or 2 is
seriously limiting how much can be done with the SCSI
chain. As stated previously only one device can be
hooked to the SCSI chain with the onboard SCSI system.
This seriously limits what you can do with your
system. As for Jack, I aggree with "SMEG". People
like you who dont use these newsgroups on a regular
basis are the ones that hand out more BS than anyone
who contributes to this newsgroup. This person
requesting this information is probably more than
grateful that fellow true atarians were answering his
post.

Thanks,

Carey Christenson

So consider yourself reported to the newsgroup abuse
listed above!!! For shame!!!
Besides that I did admit that I was wrong about the 1
GB deal. But as you can see I use my Falcon on a
daily basis and dont run my 1040STf as much. I used
to have 4.5 GB 7200 RPM SCSI hooked to the 1040STf at
one time and could not remember if I had to have 9

partitions or 5. EXCUSE a man for making a wrong
stament.

Hi Derryck,

This is ken. Sorry, I've been having some problems with my ISP.

> >I am having some difficulty logging into a site with Telnet.

> You must use an IConnect-compatible Telnet client with an IConnect
> connection, unless you have also loaded the STiNG/STiK gateway IFusion
> (included with the ftp client Fiffi from ASH).

I can't imagine this not being compatabile.
This all came as a package from System Solutions.
I have Telnet Client for IConnect T2
T2 - Telnet Terminal for IConnect (release 01, 1998-05-18)

> Teli is the IConnect Telnet client.

Yes, the better one. I checked the site.
You have to have a program called KEYTAB.

I am using Keytbl. (I don't know if it is the same one)
I don't really want to make things more complicated than they
already are. I simply one to telnet to one site only.

> >I reboot, reconnect with IConnect.
> >start CAB.
> >Open local...Telnet.TTP
>
> The Open local menu item is only for loading HTML files!

Then why does it work?

According to the Docs, you first connect with IConnect.
Then double click on Telnet.TTP
I get:
============================
Parameter (dialog box)

============================
Instead of the desired:
============================
Command Line (dialog box)

If I type my address in the Parameter box,
It will not connect. Program freezes.

If I type my address in the Command Line box,
which only comes up when I use Open Local in CAB,
the program connects with the correct Port and
cursor resides at Login:

You can set Telnet up as an Internet Client in CAB.
But you can't boot it with out the Command Line.

So do I have to Install Application in MAGIC?
(Telnet.TTP)

One other thing:
ETCPATH must be set correctly.

Iconfig program under Sockets
You select the ETC folder with the file selector.
(Unless you have a system wide ETC folder set up using an
environmental variable.) - I don't understand what this means.
Where would the system wide folder reside, and what would it be called?

The default was set to Environmental Variable ETCPATH
However I have no idea where this folder is, or if it even exists!
I selected the ETC folder where I have it in CAB.

Thanks,

ken

1719. memory card ,usb and web cam

Is there any suggestions or plans for Memory Card drive, usb, and web cam for Atari ST-E/TT/Falcon computers? I just wondering if Atari computer could make use of todays technology and why not use with atari computers. I just have a dead falcon computer at home and thinking of repairing or purchasing another Falcon computer. Just thinking why not use this features on atari computers. I heard of Cold fire but keeping close eye, and maybe invest into it unsure yet.

Anyway just writing from Guam(usa) and just look forward of using Falcon computer again....

Carey, dont bother explaining yourself to this idiot. Its probably the same
Jakas sending from a different PC, at work/home.

Foolish? No. I tried to help someone out, and I made a mistake. Dont you
EVER make mistakes?? Jackass.

OK, I've sorted that and all pages and files are present as advertised.

> I shall also upload an English configuration program for
>MagiCMac 6.20. Can't say fairer than that, now can I?

This file is also uploaded.

Cheers

Derryck

That, man, deserves a Woo! a Yay! and most certainly a Houpla!

Wish I had a TT though :(

Derryck, fantastic work you and the rest of DDP are doing! Unfortunately, I don't have an Atari machine these days so the long-awaited Texel 2 translation came a little late for me sadly. But keep your excellent work up!!

I'm keeping my eyes peeled for another Atari machine, I do miss it all.
